nominalism (nom'i-nāl-izm), *n.* [= *F. nominalisme*; as *nominal* + *-ism*.] The doctrine that nothing is general but names; more specifically, the doctrine that common nouns, as *man*, *horse*, represent in their generality nothing in the real things, but are mere conveniences for speaking of many things at once, or at most necessities of human thought; individualism. Medieval thinkers, especially those of the twelfth century, are classified as being either nominalists or realists; modern philosophers have generally joined in the condemnation of medieval realism, but have nevertheless been mostly rather realists than nominalists. The following are the most important varieties of nominalism: (a) That of the School of St. Thomas, who held that of things that is not universal, and indeed the only sort of thing that is not corporeal, is the meaning of a word (*Gr. λέξις*, *L. dictio*) as something different from the actual thought and distinct for each language. (b) That of Roscellin, condemned by the Church in 1092, which, though regarded as novel doctrine by his contemporaries, so that he has often been called the inventor of nominalism, has in fact been taught for two hundred years without attracting any particular attention. His views, so far as we can gather them from the reports of malicious adversaries, in the light of other nominalistic texts, were as follows. Various relations, usually considered as real, such as the relation of a wall to a house as a part of it, have no existence in the things themselves, but *Nominal* to the way we think about the things. Colors are nothing over and above the colored bodies. He held that nothing exists but individuals, and according to St. Anselm was "buried in corporal images." His opinion concerning universals was not called *nominalism*, but the *sententia vocum*, or *vocalism*. Anselm states that he held universals to be the *res*, but the *nomina* to be *verba* (*Gen. vocis*). This statement should not be hastily put aside as an enemy's misrepresentation, for the authorities agree that he made universals to be, not words, but vocal sounds; and since the breath was in his time and long after hardly regarded as a material thing, he may quite probably have been so buried in corporal images as to have confused the breath of the voice with an incorporeal form, which agrees with a report that he was a follower of the pantheist

Scotus Erigena. (c) That of Peter Abelard (born 1079, died 1142), which consisted in holding that universality resides only in judgments or predication. Yet he not only admits that general propositions may be true of real things by virtue of the similarities of the latter, but also holds to a Platonist doctrine of ideas. Various other kinds of nominalism are allied to that of Abelard, especially the vague modern doctrine called *conceptualism* (which see). (d) The terminism of the "Venerable Inceptor," William of Occam (died in the fourteenth century, who held that nothing except individuals exists, whether in or out of the mind, but that concepts (whether existing substantively or only objectively in the mind he does not decide) are natural signs of many things, and in that sense are universal. (e) That of Thomas Hobbes of Malmesbury (born 1588, died 1679), who added to the doctrine of Occam that there are no general concepts, but only images, so that the only universality lies in the association of ideas. This doctrine, followed by Berkeley, Hume, James Mill, and others, is specifically known as *nominalism* in modern English philosophy, as contradistinguished from *conceptualism*. (f) That of modern science, which merely denies the validity of the "substantial forms" of the schoolmen, or abstractions not based on any inductive inquiry; but which, far from regarding the uniformities of nature as mere fortuitous similarities between individual events, maintains that they extend beyond the region of observed facts. Properly speaking, this is not nominalism. (g) That of Kant, who maintained that all unity in thought depends upon the nature of the human mind, not belonging to the thing in itself.

They adopted to a large extent the customs and language of the French. In the eleventh century their duke conquered England (see *Norman Conquest*), and about the same time Norman adventurers established themselves in southern Italy and Sicily. Since the reign of John (1199–1216) the duchy of Normandy has been, except for a short period, a part of France.

with the grandeur attendant upon great size and solidity. The more specific characteristics are—churches cruciform with apse and apsidal chapels, and a great tower rising from the intersection of nave and transept; vaults, plain and semi-cylindrical; doorways, the glory of the style, deeply recessed, often with rich moldings, covered with surface sculpture, sometimes continuous around both jamb and arch, but more usually springing from a series of shafts, with plain or enriched capitals; windows small, round-headed, placed high in the wall, and opening inward with a wide spay; piers massive, cylindrical, octagonal, square, or with engaged shafts; capitals cushion-, bell-, or lily-shaped, sometimes plain, more frequently sculptured in fanciful forms or in a reminiscence of the Corinthian or Ionic; buttresses broad, with but small projection; walls frequently decorated with bands of arcade of which the arches are single or interlaced. Toward the close of the twelfth century the style became much modified. The arches began to assume the pointed form; the vaults to be groined or formed by the intersection of two subsidiary vaults at right angles; the piers, walls, etc., to become less heavy; the towers to be developed into spires; and the style, having assumed in every particular a more delicate and refined character, passed gradually into a new style, the early Pointed. Besides ecclesiastical buildings, the Normans reared many noble and powerful fortresses and castellated structures, the best remaining specimen of which in England is the White Tower or Keep of the Tower of London.—*Norman Conquest*, or simply the *Conquest*, in *Eng. hist.*, the conquest of England by William, Duke of Normandy (William the Conqueror). It was begun by and is usually dated from his victory at Senlac (Hastings) in 1066. The leading results were the

north (nôr-'tîr), *n.* [*< north + -er.*] 1. A strong cold northerly wind.—2. A violent cold north wind blowing, mainly in winter, over Texas and the Gulf of Mexico. A norther is always preceded by the passage of a cyclone, of which, in fact, it is the rear part. On the east side of a cyclone prevail warm, moist, southerly winds, while on the west side the winds are northerly. In the winter, when the temperature gradient from the Gulf of Mexico northward over Texas is very steep, the northerly winds following the passage of the center of a cyclone at times blow over this region with great fury, producing a very sudden and great fall of temperature. The Gulf, moreover, often causes wrecks in the Bay of Campechy, on a lee shore.

Sometimes, instead of changing, the preceding wind dies entirely away, and a dead, oppressive, suffocating cal ensues, to be broken in a few hours by the wild bursts of the descending Norther.

Hence *noze*, *nozzle*, *muzzle*.] 1. The special organ of the sense of smell, formed by modifications of certain bones and fleshy parts of the face, its cavities, or fossæ, freely communicable with the cavities of the mouth and lungs, and hence also concerned in respiration, the utterance of words or vocal sounds, and taste. It is lined throughout by a highly vascular mucous membrane called the *pituitary* or *Schneiderian*, continuous with the skin through the nostrils, the conjunctiva of the eye, and the mucous membrane of the pharynx and sinuses. It is in this membrane that the fine filaments of the olfactory nerves terminate, and over it the inspired air containing odorous substances passes. The olfactory region, or that region to which the olfactory nerves are distributed, however, includes only the upper and middle turbinate parts of the nasal fossæ and the upper part of the septum; the lower part of the cavities has nothing to do with olfaction. Externally the nose commonly forms a prominent feature of the face or facial region of the head; when very long it becomes a *proboscis*, and may acquire a tactile or manual function, as in the elephant, hog, mole, etc. The nose of an animal when moderately prominent is usually called a *mout*, *muzzle*, or *snuff*. The bridge of the nose is so much of its external prominence as is bridged over or rooted in by the nasal bones. The external opening of the nose is the *nostril*, usually paired, right and left, and technically called *naris*. The inner passages or cavities of the nose are the *nasal fossæ* or *meatus*; they open inferiorly into the pharynx by the *choana*, by orifices called the *posterior naris* or *choana*, above the soft palate. The animal whose nose most resembles man's in size and shape is the proboscis-monkey, *Nasalis larvatus*, whose nose is

more prominent than that of most men. Prominence of the nose is to some extent an indication of ascent in the scale of human development, the nose being flattest in the lowest or negroid races. A large nose is commonly supposed to indicate strength of character, and thin clean-cut nostrils are generally a sign of high nervous organization. Besides its special function of smelling, the nose has in all animals a respiratory office, but, rather than the mouth, the usual passageway for air in both inspiration and expiration; it also serves to modify or modulate the voice, and to discharge the secretion from several cavities of the head, as the frontal and other sinuses, and the tears from the eyes. See cuts under *mout*, *nasal*, *Nasalis*, and *Condyliana*.

a, a', Nosings.—Stairs and Buttress.

than 8 is 2 below zero. But when a value has + or - after it and no quantity following, what is meant is that

something further is to be added or subtracted. The sign \pm , called *plus* or *minus*, is ordinarily used in a disjunctive sense in writing the root of a quadratic equation. Thus, if $x^2 + x = 1$, we write $x = -\frac{1}{2} (1 \pm \sqrt{5})$, meaning that the equation is satisfied by the two values $x = -\frac{1}{2} (1 + \sqrt{5})$ and $x = -\frac{1}{2} (1 - \sqrt{5})$. The sign \pm is also used in astronomy, geodesy, etc., after a value determined by observation, to introduce the probable error of that determination. Summation is also signified by the letter Σ .

Thus, $\Sigma (1/6)$ means that in the expression $1/6$ all the whole numbers from 1 to n inclusive are to be successively substituted for 6 and the resulting values added together to give the quantity denoted by the expression. When the limits are not indicated, the lower one is to be understood as constant, and generally zero, and the upper one as one less than the actual value of the variable. For example, if we write $\Sigma (2x + 1) = x^2$, this signifies

$$\sum_{i=0}^{x-1} (2i + 1) = x^2.$$

In like manner, Δ is used to signify the difference, or the amount by which the quantity written after it would be increased by increasing the variable by unity. The variable may be indicated by a subscript letter. Thus, $\Delta x^2 = (x+1)^2 - x^2 = 2x + 1$, but $\Delta x^2 = x^2 - (x-1)^2 = 2x - 1$. The product of two quantities is denoted by writing them in their order, either directly, or with an interposed cross (\times) or dot (\cdot); thus, $3 \times a = 3a$. A quotient is usually denoted by one of the signs $:$ or $/$, with the dividend before it and the divisor after it, or by a horizontal line with the dividend above and the divisor below. A continued product is also written with Π , just as a summation is written with Σ ; but when the limits are not indicated, the lower one is constant, and generally unity, and the upper one the actual value of the variable. A positive whole number with the mark of admiration (!) after it denotes the continued product of all numbers from 1 up to that number inclusive; thus, $4! = 24$. Instead of the mark of admiration, a right-angled line bent at the left of the number is sometimes used; as, $\llcorner 4$. A power of a quantity is denoted by writing the exponent to the right and above the base; thus, $x^3 = x \cdot x \cdot x$. This notation is extended to symbols of operation. Thus, $\Delta^2 u = \Delta(\Delta u)$; and $\Delta^{-1} u = \Sigma u$, because $v = \Delta^{-1} \Delta u = \Delta \Sigma u$. If the exponent is included in parentheses, the quantity denoted is the continued product of a series of factors equal to the exponent, one factor being the base, and the others the result of successive operations. Thus, $x^{(3)} = x(x-1)(x-2)$. A root is denoted either by a fractional exponent, or by the sign $\sqrt[n]{}$ written before the base, with the index above and to the left; thus, $\sqrt[3]{8} = 2$. If the index is omitted, it is understood to be 2. One of the most important parts of algebraical notation is the use of parentheses, $()$, square brackets, $[\]$, braces, $\{ \}$, and vincula or horizontal lines above the expressions, to signify that the symbols so included are to be treated as signifying one quantity. Thus, $(3 + 2) \times 5 = 25$, but $3 + (2 \times 5) = 13$. Functions are usually denoted by operative symbols, especially f , F , ϕ , written before the variable, the latter being often enclosed in parentheses. If there are several variables, these are enclosed in one parenthesis and separated by commas, as $F(x, y)$. Various special functions have special abbreviations, as \log for logarithm, \sin for sine, \cos for cosine, \tan for tangent, \cot for cotangent, \sec for secant, \csc for cosecant, \sin for versed sine, \sinh for hyperbolic sine, \cosh for hyperbolic cosine, \sinh for the amplitude, \cosh for cosine of the amplitude, etc. (For the special notation of matrices, determinants, graphs, and groups, see those words.) A differential is expressed by d before the function, and a partial differential is now generally written with ∂ instead of d ; the variable is indicated, if necessary, by a subscript letter. A variation is expressed by δ before the varying quantity. A differential coefficient is most frequently expressed fractionally as a ratio of differentials, or by $\frac{d}{dx}$, etc., written before the function. But the capital D is often used; thus, $Dx^2 = 2x$, and $Dx^2 = \log x \cdot x^2$. Differentiation relatively to the time is frequently expressed by accents; thus, $s' = Ds$ and $s'' = D^2s$. Dots over the letters are also used instead of the accents, this being the original functional notation of Newton. The differential coefficients of functions are frequently denoted by accents attached to the operational symbols; thus, $f'' = D^2 f$. A number of other differential operations are indicated by special operational symbols, as ∇ for Laplace's operator. The integral of an expression is written with the sign \int , introduced by Leibnitz, before the differential. The limits of a definite integral are written above and below this sign. Besides these notations, there are many others peculiar to different branches of mathematics.

3t. Etymological signification; etymology.

The notation of a word is when the original thereof is sought out, and consisteth in the kind and the figure.

B. Jonson, Eng. Grammar, viii.

Conscience is a Latin word, and, according to the very notation of it, imports a double or joint knowledge. South.

4. In music, the act, process, or result of indicating musical facts by written or printed characters. As a process and a science, musical notation is a branch of semiotics or semiography in general. Notation is also used as a collective term for all the signs for musical facts taken together, whether regarded as a science or as a body of visible characters, may be divided into notation of pitch, of duration, of force, of style, etc. The various historic systems of notation are more particular about pitch than about the other matters. (a) The absolute and relative pitch of tones has been represented by letters, by neumes, by syllables, by numerals, by a staff, and by note values, the last notation at once. The ancient Greeks and Romans used the alphabets, assigning sometimes a separate letter or similar character to each tone of their tonal systems, and sometimes using only seven letters, which were repeated for successive octaves. The medieval notations included all the different methods, used both separately and in conjunction, letter-names being derived from the ancient notations, neumes appearing

early from an unknown source, and solmization and the staff-system being invented and developed from about the eighth or ninth century. Modern notations include all varieties except neumes. See letter-name, neume, solmization, numeral, keyboard, staff, etc. (b) In absolute and relative duration of tones has been much less fully indicated than pitch. The ancient and medieval systems were decidedly defective in this regard. The appearance about the twelfth century of mensurable music necessitated the use of characters having a definite metrical value; hence came the note-system, which was combined with the staff, and also the various systems of notation. In absolute music two methods are used—notes whose shape indicates relative time-value, and a kind of tablature peculiar to the tonic sol-fa system. (See note, tablature, tonic sol-fa (under tonic), etc.) Furthermore, the general tempo of a piece or passage is indicated by such Italian terms as *grave*, *adagio*, *andante*, *moderato*, *allegro*, *vivace*, *presto*, etc. Alterations of tempo during a piece are indicated by *accelerando*, *piu mosso*, *stringendo*, *ritardando*, *ritenuto*, *calando*, etc. The metrical treatment of individual tones is marked by *staccato*, *legato*, etc. (c) The absolute and relative force or accent of tones is still less fully indicated than pitch or duration. Vertical lines called *bars* have been used since medieval times to indicate rhythmic and metrical sections or measures, each of which begins with a primary accent. In modern music various words and arbitrary signs are used, as *forte*, *piano*, *crescendo* (\llcorner), *diminuendo* (\gg), *marcato*. (d) Other signs of various practical import are the *brace*, *repeat*, *da capo*, *dal segno*, *double bar*, *slur*, etc. See those words. (e) The general style of a piece or passage is often indicated in modern music by such terms as *ad libitum*, *agitato*, *arpeggio*, *cadenza*, *espressivo*, *sostenuto*, *con brio*. (f) Specific directions about performance by the voice or an instrument also occur, as *mezza voce*, *arcato*, *portamento*, *divisi*, *mano sinistra*, *pizzicato*, *staccato*, *pedal*, and many others. All these verbal marks are translated into different languages, and are subject to modification in the different styles. (g) Modern music, following the later medieval music, also employs to some extent a kind of numerical shorthand for harmonic facts. See *thorough-bass*, and *figured bass* (under *bass*).—Alphabetic notation, in music. See def. 4 (a).

Architectural notation, a method adopted of placing signs to figures when marking dimensions on drawings: as 'for feet,' etc. In modern times, the term has been extended to a system of abbreviating and condensing statements of the chemical composition of bodies, and of their changes and transformations, by means of symbols. In *printing*: (a) An explanatory statement, or reference to authority quoted, appended to textual matter and set in smaller type than the text. *Notes* are of several kinds. A *cut-in note* is set in a space left in the text, near the outer margin, and as nearly as possible in line with the matter referred to. A *center-note* is placed between two columns, as in cross-references in some editions of the Bible. A *side-note* or *marginal note* is placed in the outer margin of the page, parallel with the lines of the text. A *foot-note*, or *bottom note*, follows the text at the foot of the page, but does not encroach on the margin, as *side-notes* do. A *shoulder-note* is one at the upper inner corner of a page. In some countries, as China and Japan, all notes are placed at the top of the page. Fortnightly Rev., N. S., XXXIX. 286.

12. A small size of paper used for writing letters or notes.—13. In *music*: (a) In the staff notation, a character or sign by which a tone is recorded and represented to the eye. A *note* consists of from one to three parts—the *head*, the *stem* or *tail*, and one or more *pennants*, *flags*, or *hooks*, ♩ , ♪ , ♪ , which are often extended from one note to another in the form of bars, when two or more notes of the same denomination are grouped together. The pitch of the tone is indicated by the position of the note on the staff relative to the clef and the key-signature. (See *staff*, *clef*, *signature*, *key*.) The relative duration of the tone is indicated by the shape of the note. The system of notes now in use includes the following: the *breve*, ♭ ; the *semibreve* or *whole-note*, ♩ ; the *minim* or *half-note*, ♪ ; the *crotchet* or *quarter-note*, ♩ ; the *quaver* or *eighth-note*, ♩ ; the *semiquaver* or *sixteenth-note*, ♩ ; the *demisemiquaver* or *thirty-second-note*, ♩ ; and the *hemidemisemiquaver* or *sixty-fourth-note*, ♩ .

Each of these notes may be placed upon any staff-degree, and thus may signify a tone of any pitch whatever. Each of them, also, may have any time-value whatever, but when in a particular piece or passage a definite time-value is assumed for any one of them, a *breve* is then the *semibreve*, a *minim* is the *semibreve*, a *minim* to two *crotchets*, etc. In other words, as a metrical notation, this system of notes is relative to an assumed value for one species, but absolute and definite after such an assumption. The pitch-value of a note may be modified by an *accidental* (which see), though the latter may also be regarded as changing the staff rather than the note. The time-value of a note may be modified by various marks, such as a *dot* after it (as ♩ or ♩), which lengthens the note by one half its original value; the *tie* (♩ or ♩), which binds two notes on the same pitch together and adds their respective values together; the *pause*, *hold*, or *fermata* (♩ or ♩), which lengthens the value of the note indefinitely according to the will of the performer; the *staccato* (♩ or ♩), which shortens the actual duration of the note and supplies the deficiency by a silence or rest. (See the various words.) This system is derived from the medieval system, though with important changes. The Gregorian system of notes, which is still in use, is much nearer to the medieval system. It includes the following notes: the *large*, ♩ ; the *long*, ♩ ; the *breve*, ♩ ; and the *semibreve*, ♩ . These in turn were derived from the early neumes. They were first used merely as indications of pitch, their time-value being indefinite, and dependent wholly upon the text sung to them; but they acquired a definite metrical significance under mensural music. In modern usage they are generally treated as metrical. A special development of the ordinary system of notes is that of *character-notes*, which are varied in shape so as to indicate not only various time-values, but also the scale-values or characteristic qualities of the tones indicated. Thus, the tonic or *do* is always represented by one shape, the dominant or *sol* by another, the subdominant or *fa* by a third, etc. The system thus aims to secure at once the utility of the staff and of a reference to the abstract scale. (b) A musical sound or tone, in general or particular: as, the *note* of a bird; the *first note* of a song, etc. [This use of the word, as applied to musical tones, is very common, but is confusing and inaccurate.]

To lither here laies and here louchele *notes*.

thus destroy the inference. (b) Such circumstances as ought to excite the attention of a person of ordinary prudence, and lead him to make further inquiry which would disclose the fact: more specifically designated *constructive notice*.

Constructive notice is imputed by the law irrespective of the existence of actual notice, as where a deed is recorded, and a purchaser of the land neglects to consult the record, in which case the record is constructive notice; or where a purchaser takes a title from the former owner of land, relying on the fact that the record title is in him, while in fact a prior purchaser is in actual possession of the land, having paid for it, in which case the possession is constructive notice; and in either case the later purchaser, not having made inquiry, may be chargeable as if he had had actual notice of the prior purchaser's right.

Constructive notice originated in the equitable rule that a man may, for the protection of the rights of a third person, be treated as if he had notice, when he had the means of information. (c) Information communicated by one party in interest to another, as where a contract provides that it may be terminated by either party on notice: more specifically designated *express notice*.

The effect of such a notice is to charge the drawer or indorser with liability as such.—**Notice of protest**, in *com. law*, a notice of dishonor which states that a bill or note has been protested. But this term is often used in the popular sense of protest as not necessarily implying technical notarial protest, except in the case of paper, such as a foreign bill, which requires such technical protest.—**Reading notice**, a paid advertisement in a newspaper inserted in such form, style of type, etc., as to have the appearance of current news-matter or of an editorial utterance.—**To give notice**. A general concept; a mental representation of a state of things. Thus, the general enunciation of a geometrical theorem is comprehended by means of notions, and only in that way can the property to be proved be firmly seized by the mind, and kept distinct from other properties of the same figure; but in order to prove the theorem a construction or diagram is requisite, involving a representation in the imagination capable of being studied so as to observe hitherto unknown relations in it.

A complexion of *notions* is nothing else but an affirmation or negation in the understanding or speech.

Burgersdicius, tr. by a Gentleman, I. ii. 4.

Concept or *notion* are terms employed as convertible; but, while they denote the same thing, they denote it in a different point of view. Conception, the act of which concept is the result, expresses the act of comprehending or grasping up into unity the various qualities by which an object is characterized; *notion*, again, signifies either the act of apprehending, signaling—that is, the remarking or taking note of the various notes, marks, or characters of an object which its qualities afford; or the result of that act. . . . The term *notion*, like conception, expresses both an act and its product.

Addison, Tory Foxhunter.

A *notion* may be inaccurate by being too wide.

3. In the *Lockian philos.*, a complex idea.

The mind often exercises an active power in making these several combinations; for, it being once furnished with simple ideas, it can put them together in several compositions, and so make variety of complex ideas, without examining whether they exist so in nature. And hence I think it is that these ideas are called *notions*, as if they had their original and constant existence more in the thoughts of men than in the reality of things.

Locke, Human Understanding, II. xxii. § 2.

4. [Trans. of G. Begriff.] In the Hegelian *philos.*, that comprehensive conception in which conflicting elements are recognized as mere factors of the whole truth.—5. notochord (nō'tō-kōrd), *n.* [*Gr. νῶτος*, the back, + *χορδή*, a string.] The chorda dorsalis or primitive backbone: a fibrocellular or cartilaginous rod-like structure which is developed in vertebrates as the basis of the future spinal column, and about which the bodies of the future vertebræ are formed. It is one of the earliest embryonic structures, and persists throughout life in many of the lower vertebrates, which are on this account called *notochordal*; but in most cases it is soon absorbed and replaced by a definite cartilaginous or bony spinal column. The soft pulpy substance which may be seen filling in the cupped ends of the vertebrae of a fish, as brought to the table, is a part or the remains of the notochord. Anteriorly, in skulled vertebrates, the notochord runs into the base of the skull as far as the pituitary fossa. (See *parachordal*.) The caudal division of a notochord is often called *urochord*. Such a structure is characteristic of tunicates or ascidians, called on this account *Urochorda*, and approximated to or included among vertebrates. (See *Appendicularia*.) A sort of notochord occurring in the acorn-worms has caused them to be named *Hemichorda*. (See *Balanoglossus* and *Enteroglossus*.) The posterior antennæ are modified for attachment, and the creatures live in the branchial cavity of ascidians.

noumenon (nō-ō'mē-non), *n.*; pl. *noumena* (-nā). [*<* Gr. *νοούμενον*, anything perceived, neut. of *νοοῖν*, *ppr. pass.* of *νοεῖν*, perceive, apprehend, < *νοός*, Attic *νοῶς*, the mind, the intelligence: see *nous*.] In the *Kantian philos.*: (a) That which can be the object only of a purely intellectual intuition.

If I admit things which are objects of the understanding only, and nevertheless can be given as objects of an intuition, though not of sensuous intuition (as *coram intuitu intellectuum*), such things would be called *Noumena* (intelligibilia). . . Unless, therefore, we are to move in a constant circle, we must admit that the very word *phenomenon* indicates a relation to something the immediate representation of which is no doubt sensuous, but which nevertheless, even without this qualification of our sensibility (on which the form of our intuition is founded), must be something by itself, that is, an object independent of our sensibility. . . Hence arises the concept of a *noumenon*, which, however, is not positive, nor a definite knowledge of anything, but which implies only the thinking of something without taking any account of the form of sensuous intuition. But, in order that a *noumenon* may signify a real object that can be distinguished from all phenomena, it is not enough that I should free my thought of all conditions of sensuous intuition, but I must besides have some reason for admitting another kind of intuition besides the sensuous, in which such an object can be given, otherwise my thought would be empty, however free it may be from contradictions. . . The object to which I refer any phenomenon is a transcendental object. . . This cannot be called a *noumenon*.

Kant, *Critique of Pure Reason* (tr. by Max Müller, 1881), pp. 217, 219.

In a negative sense, a *noumenon* would be an object not given in sensuous perception; in a positive sense, a *noumenon* would be an object given in a non-sensuous, i. e. an intellectual, perception.

E. Caird, *Philos. of Kant*, p. 498.

(b) Inexactly, a thing as it is apart from all thought; what remains of the object of thought after space, time, and all the categories of the understanding are abstracted from it; a thing in itself.

II. *n.* In *church hist.*, one of a sect founded in the middle of the third century by Novatianus (also called Novatus), a presbyter of Rome, who had himself consecrated bishop of Rome in opposition to Cornelius in 251. Another Novatus (of Carthage) was joint founder of the sect. Novatianus denied that the church had power to absolve or restore to communion those who after Christian baptism had lapsed or fallen into idolatry in time of persecution, and his followers appear to have refused the grant of forgiveness to all grave post-baptismal sin and denied the validity of Catholic baptism, considering themselves the true church. They assumed the name of *Cathari*, 'the Pure,' on the strength of their severity of discipline. In other respects than those mentioned the Novatians differed very little from the Catholics; and they were generally received back into communion on comparatively favorable terms. The sect continued to the sixth century. See *Sabbatian*.

3. In *law*, the substitution of a new obligation for an old one, usually by the substitution of a new debtor or of a new creditor. The term, however, is sometimes used of the substitution of a new obligation between the original parties, as the substitution of a bill of exchange for a right of action arising out of a contract of sale, though this is more commonly called *merger* or *extinguishment*. While in an *assignment* the old claim merely passes into other hands, in a *novation* there is a new claim substituted for it. The term is derived from the Roman law, where it was of great importance, because assignment of claims did not exist. It is possible by one *novation* to extinguish several obligations: as, if A owes a debt to B, B to C, and C to D, and it is agreed that A shall pay D in satisfaction of all, this promise, if consented to by all parties, extinguishes all the other claims, even though not performed.

The *Novels*, together with the *Institutes*, Code, and *Digest*, form the body of law which passes under the name of Justinian. Also *novella*.

4. A fictitious prose narrative or tale, involving some plot of more or less intricacy, and aiming to present a picture of real life in the historical period and society to which the persons, manners, and modes of speech, as well as the scenery and surroundings, are supposed to belong. Its method is dramatic, and the novel may be regarded as a narrative clothed to the extent of the various persons or characters, upon whose qualities and actions the development and consummation of the plot or motive depend, are brought upon the scene to play their several parts according to their different personalities, disclosing, with the aid of the author's delineation and analysis, diverse aspects of passion and purpose, and contributing their various parts to the machinery of the drama to be enacted among them. The novel may be regarded as representing the third stage of transition in the evolution of fictitious narrative, of which the epic was the first and the romance the second. The novel in its most recent form may be divided, according to its dominant theme or motive, into the philosophical, the political, the historical, the descriptive, the social, and the sentimental novel; to which may be added, as special forms, the novel of adventure, the novel of society, the novel of character, the novel of criticism and satire, the novel of reform, and the military, the nautical, and the sporting novel.

Our Amours can't furnish out a Romance; they'll make a very pretty Novel.

Dime novel. See *dime*. — *Novels* (or *Novellæ*) of Justinian. See *def. 3*. — *Syn. 4. Tale, Romance, Novel.* *Tale* was at one time a favorite word for what would now be called a *novel*, as the *tales* of Miss Austen, and it is still used for a fiction without chief interest lies in its events, as Murry's *sea tales*. "Works of fiction may be divided into *romances* and *novels*. . . . The *romance* chooses the characters from remote, unfamiliar quarters, gives them a fanciful elevation in power and prowess, surrounds them by novel circumstances, verges on the supernatural or passes its limits, and makes much of fictitious sentiments, such as those which characterize chivalry. The *novel*, a rational novel has points of close union with the earlier *romance*. . . . The *novel*, so far as it adheres to truth, and treats of life broadly, descending to the lowest in grade, deeply and with spiritual forecast, seeing to the bottom, is not only not open to these objections, but rather calls for . . . commendation." In zool., the nucleus of a nucleus; one of the rounded deeply staining structures found in the nucleus of a cell. The relation they bear to the nuclear network is still uncertain. Some consider them as distinct from the nuclear network (Flemming); others consider them as merely thickened knots of

the network (Klein). The nucleolus of the human ovum was discovered by Wagner in 1836, and hence is sometimes called the *spot of Wagner* in anatomical text-books. See cut under cell, 5.

A large, clear, spherical nucleolus is seen in the interior of the nerve-cell; and in the centre of this is a well-defined small round particle, the *nucleolus*.

Huxley, Crayfish, p. 187.

2*t*. Specifically, in *Infusoria*, a minute particle attached to the exterior of the nucleus (or "ovary"), supposed to function as a testicle. But since it is the essential characteristic of a nucleolus to be contained within a nucleus, these so-called nucleoli of protozoans are now differently interpreted, and called *paramaculi*. See *paramaculus*.

3. In *bot.*, a small solid rounded granule or particle in the interior of the nucleus. There may be several nucleoli in each nucleus.

nucleus (nū'klē-us), *n.*; pl. *nuclei* (-ī). [*L. nucleus*, a little nut, a kernel, the stone of a fruit, for **nucleus* (cf. equiv. *micula*, dim. of *nux* (*nuc-*), a nut. Not related to *E. nut*.] 1. A kernel; hence, a central mass about which matter is collected, or to which accretion is made; any body or thing that serves as a center of aggregation or assemblage; figuratively, something existing as an initial or focal point or aggregate: as, a *nucleus* of truth; a *nucleus* of civilization.

Then, such stories get to be true in a certain sense, and indeed in that sense they may be called true throughout; for the very *nucleus*, the fiction in them, seems to have come out of the heart of man in a way that cannot be imitated of malice.

Hawthorne, Septimius Felton, p. 111.

The regiments fashioned by his [Cromwell's] master hand, steady, perfectly ordered, and enthusiastic in their cause, became the *nucleus* of the far-famed Ironsides.

Edinburgh Rev., CLXV. 465.

(*a*) In *bot.*, the kernel of a cell, in general; a central or interior differentiated mass of protoplasm, found in nearly all cells, vegetable or animal, and consisting of an oval or rounded body composed of (1) a nuclear membrane, (2) nuclear network, and (3) nucleoplasm, and containing nucleoli. The nuclear network is made up of threads or fibrils which are composed of a deeply staining part, "chromatin," and a feebly staining intermediate substance, "linin" or parachromatin (nucleohyaloplasm). In the meshes of the network is found the more fluid part of the nucleus, the nucleoplasm (achromatin, karyochylema, paralinin). Nucleoplasm, according to Carnoy, consists of a plastin network and a granular fluid, "enchylema." The nuclear network is considered by some to be an inner limiting layer of cell-protoplasm surrounding the nucleus, by others to be a condensation of the peripheral portion of the nuclear network. There may be but one nucleus or several nuclei in one cell; and a nucleus may be nucleolate or not. Nuclei are generally proportionate in size to the cell containing them; in some instances, however, they form a conspicuous exception.

A structural difference between the nucleus and the rest of the cell-protoplasm is indicated by its greater resistance to powerful reagents, and by its varied reaction with stains. Functionally, the nucleus is the most important portion of the cell, as it is here that the complex series of changes known as karyokinesis take place, resulting in the division of the nucleus and followed by the division of the cell. This process of mitotic or indirect cell-division is found in all varieties of cells, whether vegetable or animal, fetal or adult, normal or pathological. Instances of cell-division not mitotic have, however, been noted. The nucleus of the human ovum was discovered by Purkinje in 1825, and hence is often called the *corpuscle of Purkinje*.

The usual names for the body of an egg of a cell are, therefore, *nucleus*, *nucleolus*, *chromatin*, *linin*, *parachromatin*, *nucleohyaloplasm*, *enchylema*. See cut under cell, 5. (*b*) In *zool.*, (1) In ascidians, the alimentary and reproductive viscera collectively, when these are aggregated into a mass, as in the salps. (2) In protozoans, a solid rod-like or strap-shaped body, having in many cases the functions of an ovary in connection with a nucleolus (see *nucleolus*, 2). (3) In echinoderms, the madreporian for the body of an egg of a cell, therefore of ganglion-cells in the brain, or other portion of the cerebrospinal axis. (*d*) In *conch.*, the embryonic shell which remains at the apex of the mature shell, as of a gastropod; also, the initial point from which the operculum of a gastropod grows. See *protoconch*. (*e*) A body having a stronger or weaker attraction for the gas, vapor, or salt of a solution than the liquid in which it is dissolved, thus modifying by its presence the freezing and boiling points. *Rosier*. (*f*) In *astron.*, the bright central point usually present in the head of a comet and often in a nebula.

5. In *law*, such a use of property or such a course of conduct as, irrespective of actual trespass against others or of malicious or actual criminal intent, transgresses the just restrictions upon use or conduct which the proximity of other persons or property in civilized communities imposes upon what would otherwise be rightful freedom. Thus, the use of steam-power, though on one's own premises and for a lawful purpose, may be a *nuisance*, if by reason of being in one of several closely built dwellings the vibration and noise cause unreasonable injury to the adjacent property and occupants. Any serious obstruction to a highway or navigable river if not authorized by law is a *nuisance*; but the temporary use of a reasonable part of a highway for a legitimate purpose, such as the moving of a building or the deposit of building material as going into use, is not necessarily a *nuisance*. The question of *nuisance* always is at what point the selfish use of a right transcends the obligation to respect the welfare of others. A *common nuisance*, or *public nuisance*, is one which tends to the annoyance of the public generally, and is therefore to be redressed by forcible abatement or by an action by the state, as distinguished from a *private nuisance*, or one which causes special injury to one or more individuals and therefore will sustain a private action. Thus, if one obstructs a highway any person may remove the obstruction, but only the public can prosecute the offender, unless a particular individual suffers special injury, as when he is turned from his road and compelled to go another way and suffers thereby a specific pecuniary damage, in which case it is as to him a private *nuisance*, and he may sue.

S. hist.*, the action of a State intended to abrogate within its limits the operation of a federal law, under the assumption of absolute State sovereignty. The doctrine of nullification—that is, the doctrine that the power of a State to nullify acts of Congress is an integral feature of American constitutional law, and not revolutionary—was elaborated by John C. Calhoun, and applied by South Carolina in 1832. See *below*.

But the topic which became the leading feature of the whole debate, and gave it an interest which cannot die, was that of nullification—the assumed right of a state to annul an act of Congress. *T. H. Benton, Thirty Years, I. 183.*

The state or quality of being null or void; want of force or efficacy; insignificance; nothingness. In law, nullity exists when the instrument or act has a material but not a legal existence. (*Gouldsm.*) In civil law, a distinction is made between absolute and relative nullity. In the former, the act has no effect whatever, and anybody affected by the act might invoke the nullity of it. Such an act is said to be void. In the latter, the nullity could be invoked only by the particular persons in whose favor it is established, as where a contract is made by an infant. Such an act is said to be voidable. It is not null until so declared.

2. In *pathol.*, a constant nodding or involuntary shaking of the head. *Dunglison*.—3. In *astron.*, a small subordinate gyratory movement of the earth's axis, in virtue of which, if it subsisted alone, the pole would describe among the stars, in a period of about nineteen years, a minute ellipse, having its longer axis directed toward the pole of the ecliptic, and the shorter, of course, at right angles to it. The consequence of this real motion of the pole is an apparent approach and recession of all the stars in the heavens to the pole in the same period; and the same cause will give rise to a small alternate advance and recession of the equinoctial points, by which both the longitudes and the right ascensions of the stars will be also alternately increased or diminished. This nutation, however, is combined with another motion—namely, the precession of the equinoxes—and in virtue of the two motions the path which the pole describes is neither an ellipse nor a circle, but a gently undulated ring; and these undulations constitute each of them a nutation of the earth's axis. Both these motions and their combined effect arise from the same physical cause—namely, the action of the sun and moon upon the protuberant mass at the earth's equator. See *precession*.

The phenomena of Precession and Nutation result from the earth's being not centrobatic, and therefore attracting the sun and moon, and experiencing reactions from them, in lines which do not pass precisely through the earth's centre of inertia, except when they are in the plane of its equator. *Thomson and Tait*, Nat. Phil., § 825.

seed is thoroughly dried, the shell then cracked, and the olive-shaped kernel, about an inch in length, commonly treated with lime for preservation, becomes the nutmeg of commerce. 1. The fifteenth letter and fourth vowel in our alphabet. It followed *N* also in the Italian systems, but was separated from it in Greek and Phœnician by another character, which in the latter had the value of a syllable, and in the former that of the compound *ks* (x). The *O*-character, accordingly, was the sixteenth in the Phœnician alphabet, and it represented there the 'ain, a very peculiar and to us unpronounceable guttural; the Greeks (as in the case of *E*: see that letter) arbitrarily changed its value to that of a vowel, corresponding in quality to our "long *a*". There is no traceable Egyptian prototype for the character; the comparison of older forms is therefore as follows:

 Egyptian.
 Hieratic.
 Phœnician.
 Early Greek and Latin.

It thus appears that the belief, not uncommonly held, that *O* represents, and is imitated from, the rounded position of the lips in its utterance, is a delusion. The historical value of the letter (as already noticed) is that of our *o*, in *note*, etc., whether of both long and short quantities, as in Latin and the earliest Greek, or of short only, as in Greek after the addition to that alphabet of a special sign for long *o* (namely *omega*, Ω, ω). This vowel-sound, the name-sound of *o*, is found in English usage only with long quantity in accented syllables. There is no closely corresponding short vowel in standard English, but only in dialectal pronunciation, as in the New England utterance of certain words (much varying in number in different individuals); for example, *home*, *whole*, *none*. What we call "short *o*" (in *not*, *on*, etc.) is a sound of altogether different quality, very near to a true short *a* (that is, a short utterance corresponding to the *a* of *arm*, *father*), but verging slightly toward the "broad" *a* (*ā*) or *o* (*ō*) of *loud*, *lord*. "Short *o*" has a marked tendency to take on a "broader" sound, especially before *r*, and especially in American; hence the use, in the spellings of this work, of *o*, which varies in different mouths from the full sound of *ā* to that of *ā*. After these three values of the character, the next most common one is that of the *oo*-sound, the original and proper sound of *u* (represented in this work by *ū*), as in *move*, with the nearly corresponding short sound (marked *ū*) in a few words, as *woof*, *woman*. All these vowel-sounds partake of what is usually called a "labial" or a "rounded" character: that is to say, there is involved in their utterance a rounding and closing movement of the lips (and, it is held, of the whole mouth-cavity), in different degrees—least of all in *ō*, more and more in *ā*, *ū*, *ū*; in the last, carried to its extreme, no closer rounding and approximation being possible. The labial action helps to give the vowel-sounds in question their fully distinctive character, but it can be more or less slighted without leaving them unrecognizable, and, in the generally indifferent habit of English pronunciation, is in a degree neglected, even in accented syllables, and yet more in unaccented. Our "long *ō*" it should be added, regularly ends with a vanishing sound of *oo* (*ū*), as our *ā* with one of *e*. *ō* also lies in many words the value of the "neutral" vowels of *of*, *heart*: for example, in *son*, *come*, *love*, *work*. *ō* is further a member of several very common and important digraphs: thus, *oo*, the most marked representative of the *ū*-sound (in *moon*, *rood*, etc.), but also pronounced as *ū* (*book*, *look*, etc.) and *ū* (*blood*, etc.); *ou* (in certain situations *ū*), oftenest representing a real diphthong (in *out*, *sound*, *now*, etc.), but also a variety of other sounds (as in *through*, *could*, *ought*, *rough*); *oi* (in certain situations *ū*), standing for a real diphthongal sound of which the first element is the "broad" *c*- or *a*-sound (for example, *point*, *boy*); *oa* (*load*, etc.), having the "long" *o*-sound; others, *aeo* (variously pronounced, as in *people*, *yeoman*, *jeopard*), *oe* (in *foe*, *does*, etc.), are comparatively rare.

A tree or shrub of the genus *Quercus*, a large and widely dispersed group, chiefly of forest-trees. In its nobler representatives the oak as "the monarch of the forest" has always been impressive, and it anciently held an important place in religious and civil ceremonies. Oak chaplets were a reward of civic merit among the Romans; the Druids venerated the oak as well as the mistletoe which grows upon it. The timber of many species is of great economic value, and the bark of several is used for tanning and dyeing and in medicine. (See *oak-bark* and *quercitron*.) One species furnishes cork (see *cork*). The fruit-cups of some are used in tanning (see *valonia*). (See also *galls*, *kermes*, and *kermes-oak*.) The oak of English history and literature is chiefly the British oak, *Quercus Robur*, having two varieties, *pedunculata* and *sessiliflora*, often regarded as species. The species is distributed throughout a great part of Europe and in western Asia. It attains great age, with an extreme height of 120 feet. For ship-building its timber is considered invaluable, having the requisite toughness and most other qualities without extreme weight, and until recently it was the prevailing material of British shipping. It is also used for construction, cabinet-work, etc. Its bark is

The action of an oar in moving a boat is that of a lever, the rower's hand being the power and the water the fulcrum. Oars are frequently used for steering, as in whale-boats.

Others compare the AS. *etan*, E. *eat* (cf. *át* = Icel. *áta*, also *eti*), meat, prey; but why oats should be singled out as 'that which has a rounded shape' or 'that which is eaten,' from other grains of which the same is equally or more true, is not clear.] 1. (a) A cereal plant, *Avena sativa*, or its seed: commonly used in the plural in a collective sense. The oat was already in cultivation before the Christian era, and is sown in a variety of soils in all cool climates, degenerating

toward the tropics, yet not ripening quite as far north as barley. Oats are grown chiefly as food for beasts, especially horses, being most largely so used in the United States; but they also form an important human food (especially in Scotland, of late years somewhat in the United States), in point of nutrition ranked higher by some than ordinary grades of wheat flour. (See *oatmeal*, *groats*, and *sowens*.) All the varieties of the ordinary cultivated oat are referred to *A. sativa*, but this is believed by many to be derived from the wild oat, *A. fatua*. The race called *naked oat*, sometimes regarded as a species, *A. nuda*, differs from other sorts in having the seed free from the glume. It is successful in Ireland, etc., but not in America. A variety well approved in both hemispheres is the potato-oat, with a large white plump grain, the original of which was found growing accidentally with potatoes. The black Poland is another esteemed variety; the Tartarian and the Siberian are recommended for poor soils. The varieties are numerous, new ones constantly appearing.

(b) Any species of *Avena*. The wild oat of Europe, *A. fatua*, is a weed of cultivation in many places; in California, where it abounds, it is extensively utilized as hay. The animal, fly, or hygrometric oat, *A. sterilis*, native in Barbary, has two long, strong, much-bent awns, which twist and untwist with changes of moisture, and so become a means of locomotion. Various species are more or less available for pasture.

Dan. ed* = *Goth. aiths*, an oath; prob. = *Olir. oeth*, an oath; no other forms found; root unknown.] 1. A solemn appeal to the Supreme Being in attestation of the truth of some statement or the binding character of some covenant, undertaking, or promise; an outward pledge that one's testimony or promise is given under an immediate sense of reverence to God.

For this seyn, He that swerthe will discerpe his Neighbore: and therefore alle that thei doo, thei doo it with-outen *Othe*.

Dryden, Vind. of Duke of Guise.

All the officers appointed by congress were to take an oath of fidelity as well as of office.

Bancroft, Hist. Const., II. 113.

2. The form of words in which such attestation is made. Oaths are of two kinds: (a) assertory oaths, or those by which something is asserted as true, and (b) promissory oaths (see *promissory oath*, *oath of allegiance*, and *oath of office*, below). Witnesses are allowed to take an oath in any form which they consider binding on their conscience. Provision is made in the cases of those who have conscientious objections to the taking of an oath, or those who are objected to as incompetent to take an oath, whereby they are allowed to substitute an affirmation or solemn promise and declaration. Oaths to perform illegal acts do not bind, nor do they excuse the performance of the act.

3. A light or blasphemous use of the name of the Divine Being, or of anything associated with the more sacred matters of religion, by way of appeal, imprecation, or ejaculation.

And especially in youth gentlemen ben tawght
To swere gett *oths*, they say for jentery;
Every boy wryeth if he annex to curtesy;
MS. Laws, 15, f. 32. (Halliwell, under jentery.)

Swear me, Kate, like a lady as thou art,
A good mouth-filling oath.

The Axes so oft blustered their tender fingers that many times every third blow had a loud oath to drown the echo.
Quoted in *Capt. John Smith's Works*, I. 137.

The Accusing Spirit, which flew up to Heaven's chancery with the oath, blushed as he gave it in; and the Recording Angel, as he wrote it down, dropped a tear upon the word, and blotted it out forever. *Sterne, Tristram Shandy*, vi. 8.

4. Loosely.—(a) An ejaculation similar in form to an oath, but in which the name of God or of anything sacred is not used.

And laughed, and blushed, and oft did say
Her pretty oath, by Yea and Nay.

Scott, Marmion, v. 11.

(b) An imprecation, differing from a curse in its less formal and more exclamatory character: it may be humorous, or even affectionate, among rude and free-living men. (c) An exclamatory word or phrase, usually without appropriateness to the subject in hand, expressing surprise, and generally displeasure, though sometimes even approval or admiration. It may refer to something sacred, and even be what is called blasphemous, but is often wholly unmeaning, or is a corruption or softening of an originally blasphemous expression, as *swounds!* for *God's* (Christ's) *wounds*, *good for by God*, etc.—**Corporal oath.** See *corporal*.—**Highgate oath!** a jocose asseveration which travelers toward London were required to take at a tavern at Highgate. =*Syn. 1. Obdurate, Callous, Hardened.* These words all retain the original meaning of physical hardening, although it is obsolescent with *obdurate*. In the moral signification, the figure is most felt in the use of *callous*, which indicates sensibilities to right and wrong deadened by hard treatment, like *callous* flesh. *Hardened* is less definite, it being not always clear whether the person is viewed as made hard by circumstances or as having *hardened* himself against better influences and proper claims. *Obdurate* is the strongest, and implies most of determination and active resistance. plan, generally finished with a pyramidal apex.

The apex in the typical obelisks of ancient Egypt was

sheathed with a bronze cap. The proportion of the thick-

ness to the height is nearly the same in all Egyptian obelisks—that is, between one ninth and one tenth; and the

thickness at the top is never less than half nor greater

than three fourths of the thickness at the base. Egypt

abounded with obelisks, which were set up to record the

honors or triumphs of the kings; and many have been

removed thence, in both ancient and modern times.

The two largest were erected by Sesostris in Heliopolis; the

height of these was 78 feet; they were removed to Rome

by Augustus. Two obelisks in Alexandria, known as Cleo-

patra's Needles, were offered by Mehmet Ali to Great

Britain and France respectively. The French chose in-

stead the Luxor obelisk, which was erected in the Place

de la Concorde in Paris in 1833. That chosen by the British

lay prostrate in the sand until it was removed and erected

on the Thames embankment in London, in 1878, by private

enterprise. Its height is 68 feet 5 inches, and its dimen-

sions at the base are 7 feet 10 inches by 7 feet 5 inches.

The companion obelisk was afterward presented to the city

of New York, where it now stands in Central Park, having

been transported thither in 1880 by private enterprise.

A species of magical art or sorcery practised by the negroes in Africa, and formerly prevalent among those living in the West Indies, where it was introduced by African slaves. Traces of the same or similar superstitions and practices are still found both in the West Indies and in some of the southern United States. The charms used are bones, feathers, rags, and other trash, but it is upon a secret and skillful use of poison that the peculiar terror of the system is supposed to depend. The negroes have recourse to the *obi* for the cure of diseases, gratification of revenge, concealment of enemies, discovery of theft, telling of fortunes, etc.

Things suffer in general; the slaves run away or are inclined to be turbulent; he [the bad head driver] and they cabal; bad sugar is made; and perhaps the horrid and abominable practice of *Obia* is carried on, dismembering and disabling one another; even aiming at the existence of the white people.

object (ob-jekt'), *a.* [*L. obiectus*, pp. of *obicere, obicere*, object: see *object*, *v.*] Plainly
presented to the senses or the mind; in view;
conspicuous.

of distinction from all others as are not object unto our
sense; only unto God, who seeth their hearts, . . . they
are clear and manifest.

object (ob-jekt'), *n.* [= *F. objet* = *Sp. objeto* =

Dan. Sw. objekt, < (*a*) *L. obiectum*, a charge, ac-
cusation, *ML. an object*, neut. of *obiectus*, pp.;
(*b*) *L. obiectus*, a casting before, also that which
presents itself to the sight, an object; (*L. ob-*
jectus, pp. of *obicere, obicere*, throw before, cast
before, present: see *object*, *v.*] 1. Anything
which is perceived, known, thought of, or sig-
nified; that toward which a cognitive act is
directed; the non-ego considered as the corre-
late of a knowing ego. By the object may be meant
either a mere aspect of the modification of consciousness,
or the real external thing (whether mediately or im-
mediately perceived) which affects the senses. Opposed to
subject. (*Obiectum* in this sense came into use early in the
thirteenth century. It is remarkable as not being a trans-
lation of a Greek word.)

As Chameleons vary with their object,
So Princes manners do transform the Subject.
Sylvestre, tr. of Du Bartas's Weeks, i. 2.

His mind is not much distracted with objects; but if a
goodde fat Cowe come in his way, he stands dumbe and as-
tonisht, and, though his haste be neuer so great, will fixe
here half an houres contemplation.
Bp. Earle, Micro-cosmographie, A Plaine Country Fellow.

Cognition . . . is clear, when we are able definitely to
comprehend the object as in contradistinction from others.
Vatich, Introd. to Descartes's Method, p. lvi.

The object, in any sense in which it has a value for know-
ledge, must be something which in one way or other de-
termines the sensations referred to it.

E. Caird, Philos. of Kant, p. 283.

The object, then, is a set of changes in my consciousness,
and not anything out of it.

W. K. Clifford, Lectures, II. 70.

2. That toward which an action is directed and
which is affected by it; that concerning which
an emotion or passion is excited. The correlates
of actions, of approach, recession, attraction, repulsion, at-
tack, and the like are termed *objects*; as, the object shot at.

Those things in ourselves are the only proper objects of
our zeal which, in others, are the unquestionable subjects
of our praises.
Bp. Sprat.

Well, well, pity him as much as you please; but give
your heart and hand to a worshipful object.
Sheridan, School for Scandal, iii. 1.

ingenuity, but no other allegorist has ever been able to
touch the heart, and to make abstractions objects of terror,
of pity, and of love.
Macaulay, Hist. Eng., vii.

I say, such love is never blind; but rather
Alive to every the minutest spot
Which mars its object.
Browning, Paracelsus.

The object of desire is in a sense never fully realised,
since, however great the pleasure, the mind can still de-
sire an increase or at least a prolongation of it.

J. Sully, Outlines of Psychol., p. 562.

3. An idea to the realization of which action
is directed; purpose; aim; end.

All Prayers aim at our own ends and interests, but Praise
proceeds from the pure Motions of Love and Gratitude,
having no other Object but the Glory of God.

Howell, Letters, ii. 67.

Education has for its object the formation of character.

H. Spencer, Social Statics, p. 201.

The first object of the true politician, as of the true pa-
triot, is to keep himself and his party true, and then to
look for success; to keep himself and his party pure, and
then to secure victory.

Stubbs, Medieval and Modern Hist., p. 20.

4. A thing, especially a thing external to the
mind, but spoken of absolutely and not as rela-
tive to a subject or to any action.

Think on thy Proteus, when thou haply seest
Some rare note-worthy object in thy travels.

Shak., T. G. of V., i. 1. 13.

There is no speaking of objects but by their names; but
the business of giving them names has always been prior
to the true and perfect knowledge of their natures.

Bentham, Introd. to Morals and Legislation, xvi. 1, note.

5. In gram.: (*a*) A member of the sentence, a
substantive word or phrase or clause, imme-
diately (that is, without the intervention of a
preposition) dependent on a verb, as expressing
that on which the action expressed by the verb

is exerted. The object of a verb is either *direct* or
indirect. A direct object receives the direct action of the
verb, and is in the accusative or objective case, so far as
there is a distinctive form for that case, and a verb ad-
mitting such an object is called *transitive*: as, he saw *me*;
they gave a book: an indirect object represents something
(usually) to or for which the action is performed, and so is
in the dative case, so far as that case is distinguished (as
only imperfectly in English); thus, they gave her a book;
I made the boy a coat; but in some languages indirect ob-
jects of other cases occur. A direct object which repeats
in noun form an idea involved in the verb is called a *cog-*
nate object: as, I dreamed a dream; they run a race. The
name *factive* object is often given to an objective predi-
cate. See *predicate*.

(*b*) A similar member of the
sentence dependent on a preposition, i. e. joined
by a preposition to the word it limits or
qualifies: as, he went with *me*; a man of *spirit*.
Such an object is in English always in the accusative or
objective case; in other languages often in other cases, as
genitive, dative, ablative. The object, whether of a verb
or of a preposition, is said to be *governed*—that is,
required to be of a particular case—by the verb or preposi-
tion.

6. The aspect in which a thing is presented to
notice; sight; appearance. [Rare.]

He, advancing close

Up to the lake, past all the rest, arose

In glorious object.
Chapman.

The object of our misery is as an inventory to particu-
larize their abundance.
Shak., Cor., i. 1. 21.

7. A deformed person, or one helpless from
bodily infirmity; a gazing-stock. [Colloq.]

"What!" roars Macdonald—"Yon puir shaghtlin'
inkned scray of a thing! Would any Christian body even
yon bit object to a bonny senie weel-faured young man
like Miss Catline?"
Lockhart, Reginald Dalton, III. 119.

8. An obstacle. [Rare.]

To him that putteth not an object or let (I use the school-
men's words)—that is to say, to him that hath no actual
purpose of deadly sin, (the sacraments) give grace, right-
eousness, forgiveness of sins.

Becon, Works, III. 380. (Davies.)

Egoistical, exterior, external, first, formal, mat-
erial, mediate, etc. object. See the adjectives.

objectable (ob-jek'ta-bl'), *a.* [*OF. objectabile*;
as *object*, *v.*, + *-able*.] Capable of being made
or urged as an objection. [Rare.]

It is as objectionable against all those things which either
native beauty or art affords.

Jer. Taylor (?), Artif. Handsomeness, p. 145.

objection (ob-jek'tā'shon), *n.* [*L. objecta-*
tion (*n*), a reproach, < *obiciere*, reproach: see *ob-*
ject.] Reproach or cavi; captious objection.

All the knotty questions of the realm are referred to us,
and, when they are discussed in the common hearing, each
of us, without strict or objection, sharpens his wits to
speak well upon them.

Peter of Blais (trans.), in Stubbs's Medieval and Modern
Hist., p. 143.

object-finder (ob-jekt-fin'dér), *n.* In micro-
scopes, a device to enable the observer to fix
the position of an object in the slide under ex-
amination, so that he can find it again at will.
It is especially necessary when high powers are employed.
Various forms of finders have been devised; one of the most
common involves the use of a slide with horizontal and
vertical scales, adjusted in connection with the mechan-
ical stage.

object-glass (ob-jekt-glās), *n.* In a telescope
or microscope, the lens which first receives the
rays of light coming directly from the object,
and collects them into a focus, where they form
an image which is viewed through the eyepiece.
In the finest refracting telescopes the object-glass consists
of an achromatic combination of lenses, formed of sub-
stances having different dispersive powers, and of such
figures that the aberration of the one may be corrected by
that of the other. Ordinarily the combination consists of
a convex lens of crown-glass and a concave lens of flint-
glass, having focal lengths proportional to their dis-
persive powers. There are many different forms which ful-
fill the condition indicated, but vary in the curves of the
lenses, their thickness, their relative position, and the dis-
tance between them. The ordinary crown- and flint-
glass it is not possible to obtain perfect achromatism; with
the new kinds of glass made at Jena a much more perfect
correction is possible, and it is likely that as a result tele-
scopes will soon be greatly improved, provided the glass
can be made in pieces of sufficient size and satisfactorily
homogeneous. See *objective*, *n.*, 3, and cuts under *micro-*
scope.

objectification (ob-jek'ti-fi-kā'shon), *n.* [*< ob-*
jectify + *-ation* (see *-fication*).] The act or
process of objectifying or of making objective.
Also *objectivation*.

The diminution or increase of that which is perceived
(of course, unreflectingly) as the area of self-assertion, or
(if we like the phrase) as the objectivity of the will, is
essentially and immediately connected with our own
discomfort or pleasure.

F. H. Bradley, Ethical Studies, p. 254.

objectify (ob-jek'ti-fi), *v. t.*; pret. and pp. *ob-*
jectified, ppr. *objectifying*. [*< ML. obiectum*, an
object, + *L. -ficare*, make: see *object* and *-fy*.] To make
objective; present as an object; espe-
cially, to constitute as an object of sense; give
form and shape to as an external object; ex-
ternalize. Also *objectivate*, *objective*.

Because it [mind] is bound to think a coexistence or se-
quence, it *objectifies* the necessity.

Maudsley, Body and Will, p. 127.

He may be quite innocent of a scientific theory of vision,
but he *objectifies* his sensations.

T. H. Green, Prolegomena to Ethics, § 12.

What we start with in the child is the feeling of himself
affirmed or negated in this or that sensation; and the next
step . . . is that the content of these feelings is *objecti-*
fied in things.
F. H. Bradley, Ethical Studies, p. 251.

objection (ob-jek'tshon), *n.* [= *F. objection* =
Sp. objeción = *Pg. objecção* = *It. obbiezione, ob-*
iezione, < *LL. obiectio* (*n*), a throwing or putting
before, a reproaching, *ML. an objection*, < *L.*
obicere, obicere, pp. *obiectus*, throw before, ob-
ject: see *object*, *v.*] 1. The act of objecting or
throwing in the way; the act of resisting by
words spoken or written, by or without stating
adverse reasons or arguments, advancing criti-
cisms, or suggesting difficulties, etc.

Objection!—Let him object if he dare!—No, no, Mrs.
Malaprop, Jack knows that the least demur puts me in a
pique directly.
Sheridan, The Rivals, i. 2.

2. That which is interposed or presented in op-
position; an adverse contention, whether by or
without stating the opinion, reason, or argu-
ment on which it is founded: as, many *objections*
to that course were urged; the *objections*
of the defendant were overruled.

As for your spiteful false objections,

Prove them, and I lie open to the law.

Shak., 2 Hen. VI., i. 3. 158.

Objections to my general System

May rise perhaps; and I have mist them.

active inquiries into religious questions.

Macaulay, Gladstone on Church and State.

3. An adverse blow; an attack.

The parts either not armed or weakly armed were well
known, and, according to the knowledge, should have been
sharply visited but that the answer was as quick as the
objections.
Sir P. Sidney, Arcadia, i.

4. Trouble; care; cause of sorrow or anxiety.

Our way is troublesome, obscure, full of *objection* and
danger.
Jer. Taylor, Works (ed. 1835), i. 24.

General objection, in *law*, an objection interposed without at the same time stating the ground or reason for it. — *Syn.* 2. Exception, difficulty, doubt, scruple, cavil, demurrer.

objectionable (ob-jek'-shn-a-bl), *a.* [*< objection + -able.*] Capable of being objected to; justly liable to objection; calling for disapproval.

The modes of manifesting their religious convictions which these monks employed were so *objectionable* as to throw discredit on the very principles on which they acted. *Mivart, Nature and Thought*, p. 231.

objectionably (ob-jek'-shn-a-bli), *adv.* In an objectionable manner or degree; so as to be liable to objection.

objectist (ob'-jek-tist), *n.* [*< object + -ist.*] An adherent of the objective philosophy or doctrine. *Eclectic Rev.*

objectivation (ob-jek'-ti-vä'shon), *n.* [*< objectivate + -ion.*] Same as *objectification*.

objective (ob-jek'-tiv), *a.* and *n.* [= *F. objectif* = *Sp. objetivo* = *Pg. objetivo* = *It. obiettivo*, *obiettivo*, < *ML. objectivus*, relating to an object, < *objectum*, an object: see *object*, *n.* Cf. *subjective*.] *I. a.* 1. As perceived or thought; intentional; ideal; representative; phenomenal: opposed to *subjective* or *formal*—that is, as in its own nature. [This, the original meaning which the Latin word received from Duns Scotus, about 1300, almost the precise contrary of that now most usual, continued the only one till the middle of the seventeenth century, and was the most familiar in English until the latter part of the eighteenth.]

Natural phenomena are only natural appearances. They are, therefore, such as we see and perceive them. Their real and objective natures are therefore the same. *Berkeley*.

The faculty of the imagination, for example, and its acts were said to have a subjective existence in the mind; while its several images or representations had, qua images or objects of consciousness, only an *objective*. Again, a material thing, say a horse, qua existing, was said to have a subjective being out of the mind; qua conceived or known, it was said to have an *objective* being in the mind. *Sir W. Hamilton*, in Reid's Supplementary Disquisitions, (note B, § 1.)

Where or when should we be ever able to search out all the vast treasures of *objective* knowledge that layes within the compass of the universe? *Sir M. Hale*, Orig. of Mankind, p. 156.

[By *objective* knowledge was meant the propositions known, opposed to *formal* or *subjective* knowledge, the act or habit of knowing. Such expressions probably led to the change of meaning of the word.]

2. Pertaining or due to the real object of cognition; real: opposed to *subjective* (pertaining or due to the subject of cognition, namely, the mind). [This meaning of the word nearly reverses the original usage; yet if such passages as that from Sir M. Hale, above, on the one hand, and that from Watts, below, on the other, be compared, the transition will be seen to have been easy. Kant makes the objects of experience to be at once real and phenomenal; and what he generally means by the *objective* character of a proposition is the force which it derives from the thing itself compelling the mind, after examination, to accept it. But occasionally Kant uses *objective* to imply a reference to the unknowable thing-in-itself to which the compelling force of phenomena is due.]

Objective certainty is when the proposition is certainly true in itself; and subjective when we are certain of the truth of it. The one is in things, the other is in our minds. *Watts*, Logic, ii. 2 § 8.

[Thus, there is an *objective* certainty in things that any given man will die; and a *subjective* certainty in his mind of that *objective* certainty.]

Objective means that which belongs to, or proceeds from, the object known, and not from the subject knowing, and thus denotes what is real, in opposition to what is ideal—what exists in nature, in contrast to what exists merely in the thought of the individual.

Sir W. Hamilton, Metaph., ix.
A form of consciousness, which we cannot explain as of natural origin, is necessary to our conceiving an order of nature, an objective world of fact from which illusion may be distinguished.

T. H. Green, Prolegomena to Ethics, § 10.

If an exact objective measurement of the physical stimuli is intrinsically difficult, an exact subjective measurement of the sensations themselves is inherently impossible. *G. T. Ladd*, Physiol. Psychology, p. 361.

The number of vibrations is the *objective* characteristic of that which we perceive subjectively as colour. *Lommel*, Light (trans.), p. 226.

3. Substantive; self-existent. [This rather confusing use of the word belongs to writers of strong nominalistic tendencies.]

Science . . . agrees with common sense in demanding a belief in real objective bodies, really known as causes of the various phenomena the laws and interrelations of which it investigates. *Mivart*, Nature and Thought, p. 59.

The only other thing in the physical universe which is conserved in the same sense as matter is conserved, is energy. Hence we naturally consider energy as the other *objective* reality in the physical universe. *Tait*, in Encyc. Brit., XV. 747.

4. Intent, as a person, upon external objects of thought, whether things or persons, and not watching one's self and one's ways, nor attending to one's own sensations; setting forth, as a writing or work of art, external facts or imaginations of such matters as they exist or are supposed to exist, without drawing attention to the author's emotions, reflections, and personality.

The only healthful activity of the mind is an *objective* activity, in which there is as little brooding over self as possible. *J. Fiske*, Cosmic Philos., I. 142.

The two epics [the Iliad and Odyssey] appear on the horizon of time so purely objective that they seem projected into this visible diurnal sphere with hardly a subjective trace adhering to them, and are silent as the stars concerning their own genesis and mutual relation. *W. D. Geddes*, Problem of the Homeric Poems, ii.

The theme of his [Dante's] poem is purely subjective, modern, what is called romantic; but its treatment is *objective* (almost realism, here and there), and it is limited by a form of classic severity. *Lovely*, Among my Books, 2d ser., p. 87.

5. In *gram.*, pertaining to or noting the object of a transitive verb, or of a preposition; forming or expressing a grammatical object: as, the *objective* case; an *objective* phrase or clause. Abbreviated *obj.*—*Objective abstraction*, *beatitude*, *being*, *doubt*. See the nouns.—*Objective cause*, the external object which excites the principal cause of any effect to action; the *efficient* cause.—*Objective concept*, a concept conceived as constituting a real likeness among the objects which come under it: opposed to a *formal concept*, or the concept regarded merely as a function of thought.—*Objective end*, *ens*, *evidence*, *idealism*, etc. See the nouns.—*Objective line*, in *persp.*, any line drawn on the geometrical plane the representation of which is sought in the optical picture.—*Objective logic*, the logic of objective thought; the general account of the process by which the interaction of ideal elements constitutes the world. *Hegel*.—*Objective method*, the inductive method; the method of modern science.—*Objective philosophy*. Same as *transcendental philosophy* (which see, under *philosophy*).—*Objective plane*, any plane, situated in the optical picture, whose perspective representation is required.—*Objective point*. (a) The point or locality aimed at; the final or ultimate point to which or to reach which one's efforts or desires are directed; specifically (*metist.*), the point toward securing which a general directs his operations, expecting thereby to obtain some decisive result or advantage. Hence—(b) The ultimate end or aim; that toward the attainment of which effort, strategy, etc. are directed. *Objective power* or *potency*, that of a consistent object of thought; logical possibility; non-existence combined with non-repugnance to existence.—*Objective reality*, the reference of a concept to an object.—*Objective reason* or *thought*, in *metaph.*, reason or thought as existing not in the individual mind, but as in the real objects of cognition.

A truly *objective* thought, far from being merely ours, must at the same time be what we have to discover in things, and in every object of perception. *Hegel*, tr. by Wallace, Logic of the Encyclopedia, § 41.

Objective symptoms, in *med.*, symptoms which can be observed by the physician, as distinct from *subjective symptoms*, such as pain, which can be directly observed only by the patient.—*Objective truth*, the agreement of a judgment with reality; material truth.—*Objective validity*, applicability to the matter of sensation.

There therefore arises here a difficulty which we did not meet with in the field of sensibility, namely how subjective conditions of thought can have *objective validity*—that is, become conditions of the possibility of the knowledge of objects. *Kant*, Critique of Pure Reason (tr. by Max Müller, orig. ed.), p. 83.

II. *n.* 1. In *Eng. gram.*, the objective case; the case used to express the object of a verb or a preposition. This case answers in most of its uses to the accusative of Greek, Latin, German, and other languages, and is sometimes so called in English. In nouns it is never distinct in form from the subjective or nominative; the only objectives having such a distinct form are the pronominal case-forms *me, thee, him, her, us, them, whom*, corresponding to the nominatives *I, thou, he, she, we, they*, who respectively. Of these, *her* happens to be the same in form as the possessive. When words expressing extent in space or duration in time are put in the objective, they are called *adverbial objectives*; as, he ran a mile; she sang an hour. Compare *cognate object*, under *object*, 5. Abbreviated *obj.*

2. An objective point; especially, the object, point, or place to or toward which a military force is directing its march or its operations.

In 1864 the main *objectives* were Lee's and Johnston's armies, and the other one was thought to be Richmond or Atlanta, whichever should be longest held. *The Century*, XXXV. 595.

3. The lens, or practically the combination of lenses, which forms the object-glass of an optical instrument, more particularly of the microscope (see *object-glass*). Objectives are generally named from the focal length of a single lens which would have the same magnifying power: as, a two-inch objective or power, a one-half-inch objective (or simply a half, etc. Objectives of high magnifying power and consequently short nominal focal length (e. g., less than half an inch) are often spoken of as *high powers*, in distinction from the *low powers*, which magnify less and have longer nominal focal lengths. Objectives are also characterized as *immersion-objectives* or *dry objectives* according as they are used with or without a drop of liquid between the lens

and the object; if the liquid has sensibly the same refractive power as the glass of the lens, the system is called *homogeneous immersion*. (See *immersion*, 5.) The properties of an objective which determine its value for practical work are—definition or defining power, depending upon its freedom from spherical and chromatic aberration, which should be accompanied by flatness of field; penetration, the power of bringing parts of the object at different levels into focus at once; resolving power, the ability (depending upon the size of the aperture and the definition) to exhibit the minute details of structure, as the lines on a diatom frustule (see *test-object*); working distance, which is the space separating the lens and the object when the latter is in focus. These properties are in some degree antagonistic: thus, an increase in the aperture, and hence of the resolving power, is accompanied by a decrease in the working distance. The aperture of an objective is often measured by the angle of the cone of rays which it admits, and is then called *angular aperture*. Since, however, this angle varies according as it is used as a dry, water-immersion, or homogeneous-immersion objective, a common measure is obtained, as proposed by Abbe, by taking the product of the half-angle into the refractive index of the medium employed; this is called the *numerical aperture* (sometimes written *N. A.*). Thus, for the maximum air-angle of 180°, which is equivalent to a water-angle of 97° 31' and a balsam-angle of 87° 17', the numerical aperture is unity, while for the respective angles of 60° (air), 44° 10' (water), 38° 24' (balsam), it is 0.5. Again, a numerical aperture of 1.33 corresponds to the maximum water-angle of 180° and a balsam-angle of 122° 6'.—*Endomorphism-objective*, a form of objective, or object-glass, devised by Zeuger, in which the chromatic aberration is removed by the employment of a liquid (such as a mixture of cedar oil and fatty oils) placed between the separate lenses.

objectively (ob-jek'-tiv-li), *adv.* In an objective manner; as an outward or external thing.

Activity, *objectively* regarded, is impulse or tendency. *R. Adamson*, Fichte, p. 184.

objectiveness (ob-jek'-tiv-nes), *n.* The state or relation of being objective.

Is there such a motion or *objectiveness* of external bodies which produceth light? *Sir M. Hale*, Orig. of Mankind, p. 1.

objectivism (ob-jek'-ti-vizm), *n.* [*< objective + -ism.*] 1. In *philos.*, the tendency to magnify the importance of the objective elements of cognition; especially, the doctrine that knowledge of the non-ego takes precedence in time, in logical sequence, and in order of importance of all knowledge of the ego.—2. The character, in a work of art or in its author, of being objective, in the sense of dramatic, presenting things as they are and persons as they seem to themselves and to one another.

objectivistic (ob-jek'-ti-vis'tik), *a.* [*< objective + -ist + -ic.*] Partaking of objectivism, in either sense.—*Objectivistic logic*. See *subjectivistic logic*, under *logic*.

2. *Eccl'es.*, a loaf of unconsecrated bread prepared for use at the celebration of the eucharist; altar-bread. From the earliest times of which we have distinct information, *oblates* have been circular in form, of moderate thickness, and marked with a cross or crosses. In the Western Church they are unleavened, much reduced in size, and commonly known as *wafers*, or, especially after consecration, as *hosts*. In the Anglican Church the use of leavened bread in the celebration of the Eucharist was permitted at the Reformation, and became the prevalent though not exclusive use. The Greek Church uses a circular oblate of leavened bread, in the center of which is a square projection called the *Holy Lamb*. This projecting part alone is consecrated, and the remainder serves for the antidoron. — *Oblatus* ran in *Eng. hist.*, the account kept in the exchequer, particularly in the reigns of John and Henry III., of old debts due to the king and of gifts made to him.

The act of offering. Specifically, *eccl'es.* (a) The donation by the laity of bread and wine for the eucharist, and of other gifts or contributions in money for the maintenance of divine worship and for the support of the clergy and the poor. In the early church the bread and wine were given by members of the congregation to the deacon before the liturgy, and offered by the priest on the altar; later this custom fell into disuse, and the other gifts were presented before the offertory. The Greek practice of contributing in money for the service of the church has a special prehistory in the law of ordination in the office of prothesis (see *prothesis*), before the liturgy. (b) The offering or presenting to God upon the altar of the unconsecrated bread and wine; the offertory. (c) The solemn offering or presentation in memorial before God of the consecrated elements as sacramentally the body and blood of Christ. This is called the *great oblation*, in distinction from the *lesser oblation* or offertory. The *great oblation* forms the second part of the prayer of consecration, the first part being the words of institution, or the consecration in the stricter sense. In the Oriental liturgies, in the Scotch communion office of 1764, and in the American Book of Common Prayer, the *great oblation* is succeeded by the invocation or epiclesis.

The earliest theory of Liturgies recognised three distinct *Oblations* in the Holy Action.

Obliviousness. *Oblivion* is the state into which a thing passes when it is thoroughly and finally forgotten. An important musical instrument of the wood wind group, and the type of the family in which the tone is produced by a double reed. In its modern form it consists of a wooden tube of conical bore, made of three joints, the lowest of which is slightly flaring or belled, while the uppermost carries in its end the metal staple with its reeds of cane. The number of finger-holes varies considerably; in the larger varieties they are principally controlled by an intricate system of levers. The extreme compass is nearly three octaves, upward from the B₂ or B₃ net below middle C, including all the semitones. The tone is small, but highly individual and penetrating; it is especially useful for pastoral effects, for plaintive and wailing phrases, and for giving a ready quality to concerted passages. The normal key (tonality) of the orchestral oboe is C, and music for it is written with the G clef. The oboe has borne various names, such as *chalumeau*, *schalmey*, *shavem*, *bombardo piccolo*, *hautboy*, etc. It has been a member of the modern orchestra since early in the eighteenth century, and is the instrument usually chosen to give the pitch to others. It has also been used to some extent as a solo instrument. The oboe family of instruments includes the oboe d'amour, the oboe da caccia or tenoroon, the English horn, and the bassoon.

Its normal key was F. The tone was similar to that of the bassoon, but lighter. Also called *tenoroon* and *fagottino*.

In regard to the meaning of something said or written, obscure is general, being founded upon the figure of light which is insufficient to enable one to see with any clearness; this figure is still felt in all the uses of the word. Doubtful is literal, meaning full of doubt, but quite impossible of decision or determination, on account of insufficient knowledge. Dubious may be the same as doubtful, but tends to the special meaning of that doubtfulness which involves anxiety or suspicion: as, dubious battle; dubious prospects; a dubious character. Ambiguous applies to the use of words, intentionally or otherwise, in a way that makes certainty of interpretation impossible; but it may be used in other connections: as, an ambiguous smile. Equivocal applies to that which is ambiguous by deliberate intention. See darkness.—7. Unhonored, inglorious.

In those sciences which describe and explain provinces of the universe as it exists, such as astronomy and systematic biology, observations are, for the most part, made under circumstances or conditions which themselves are not produced at will. But in those sciences which analyze the behavior of substances under various conditions it is customary first to place the object to be examined under artificially produced conditions, and then to make an observation upon it. This whole performance, of which the observation is a part, is called an *experiment*. Formerly sciences were divided into sciences of experiment and sciences of observation, meaning observation without experiment. But now experiments are made in all sciences. It is only occasionally that the word *observation* has been used to imply the absence of experimentation.

=**Syn.** 1. *Obstinate, Stubborn, Intractable, Refractory, Contumacious, pertinacious, headstrong, unyielding, dogged, wilful, persistent, immovable, inflexible, firm, resolute.* The first five words now imply a strong and vicious or disobedient refusal to yield, a resolute or unmanageable standing upon one's own will. *Stubborn* is strictly negative; a *stubborn* child will not listen to advice or commands, but perhaps has no definite purpose of his own. *Obstinate* is active: the *obstinate* man will carry out his intention in spite of advice, remonstrance, appeals, or force. The last three of the italicized words imply disobedience to proper authority. *Intractable*, literally not to be drawn, handled, or governed, is negative; so is *refractory*: both suggest sullenness or perverseness; *refractory* is more appropriate where resistance is physical: hence the extension of the word to apply to metals. *Contumacious* combines pride, haughtiness, or insolence with disobedience: in law it means wilfully disobedient to the orders of a court.

The rapid deterioration of the vents of heavy guns in firing the latest charges now in vogue renders it indispensable that some vent-sealing device be employed to prevent the rush of gas through the vent. The most convenient way of effecting this obturation of the vent is through the action of the primer by which the piece is fired. *Gen. S. V. Benét*, in *Rep. of Chief of Ordnance*, 1884, p. 18.

It is in some animals wholly external, constituting a second obturator externus. The obturator muscles form part of a set of six muscles, known in human anatomy as *rotatores femoris* from their action upon the thigh-bone, which they rotate outward upon its axis.—Obturator ligament, the obturator membrane.—Obturator membrana. See *membrana*.—Obturator nerve, a branch of the lumbar plexus, arising from the third and fourth lumbar nerves, and distributed principally to the hip- and knee-joints and to the adductor muscles of the thigh.—Obturator tertius, the third obturator muscle of some animals, as the hyrax, arising from the inner surface of the ischium, and passing through the obturator foramen to the trochanter fossa of the femur.—Obturator vein, a tributary to the internal iliac vein, accompanying the artery.

He was a great advocate of the rule of poverty of the Franciscan order, to which he belonged, and a strong defender of the state against the pretensions of the papacy. All his teachings depend upon the logical doctrine that generally belongs only to the significations of signs (such as words). The conceptions of the mind are, according to him, objects in themselves individual, but naturally significative of classes. These principles are carried into every department of logic, metaphysics, and theology, where their general result is that nothing can be discovered by reason, but all must rest upon faith. Occamism thus prepared the way for the overthrow of scholasticism, by arguing that little of importance to man could be learned by scholastic methods; yet the Occamistic writings exhibit the scholastic faults of triviality, prolixity, and formality in a higher degree than those of any other school.

Ginger is the root . . . of an herbaceous plant . . . very common in many parts of India, growing either from root or seed, which in December and January they take up, and, gently dried, roll it up in earth; whereby, *occluding* the pores, they conserve the natural humidity, and so prevent corruption. *Str. T. Broume*, *Vulg. Err.*, ii. 6.

2. In *physics* and *chem.*, to absorb: specifically applied to the absorption of a gas by a metal, such as iron, platinum, or palladium, particularly at a high temperature. Thus, palladium heated to redness and cooled in a current of hydrogen absorbs or *occludes* over 900 times its volume of the gas. By this means the physical properties of the metal are changed, and the occluded hydrogen is regarded as existing in a solid form as a quasi-metal, sharp edges, or concave, with specific gravity, and electrical conductivity of which have been approximately determined. Probably a part of the gas forms also a definite chemical compound with the metal. Occluded gases also occur in meteorites. Thus, the Arva meteoric iron yielded (Wright) 47 volumes of the mixed gases carbon dioxide, carbon monoxide, hydrogen, and nitrogen.

Professor Graham has shown its [palladium's] remarkable power of absorbing hydrogen. When a strip of palladium is made the negative electrode in an apparatus for decomposing water, it absorbs 800 or 900 times its volume of hydrogen, expanding perceptibly during the absorption. This *occluded* gas is again given off when the substance, which Professor Graham believed to be an actual alloy of palladium and hydrogen, is heated to redness. *Madam*.

Not apparent upon mere inspection, nor deducible from what is so apparent, but discoverable only by experimentation; relating to what is thus undiscoverable by mere inspection: opposed to *manifest*. The Latin word was applied in the middle ages to the physical sciences and the properties of bodies to which those sciences relate. Its precise meaning is explained in the treatise "De Magnete" of Petrus Peregrinus. He says that an occult quality is simply one which is made apparent only upon experimentation, but that in that way it becomes as plain and clear as any other quality, and is no more mysterious. By *occult science* or *philosophy* was meant simply experimental science. There were many occult philosophers in northern Europe in the twelfth and the first part of the thirteenth century; but theology so swallowed up other interests that they are all forgotten except Roger Bacon, who was made prominent by the personal friendship of a pope. The ignorance and superstition of the time confounded occult science with magic.

These are manifest qualities, and their causes only are occult. *Newton*, Opticks.

The Aristotelians gave the name of occult Qualities . . . to such Qualities only as they supposed to lie hid in Bodies, and to be the unknown Causes of manifest Effects. *Newton*, Opticks (ed. 1721), p. 377.

occupancy (ok'ü-pän-si), *n.* [*< occupant*(*t*) + *-cy*.] 1. The act of taking possession, or the being in actual possession; more specifically, in *law*, the taking possession of a thing not belonging to any person, and the right acquired by such act; that mode of acquiring property which is founded on the principle that he who takes possession of an ownerless thing, with the design of appropriating it to himself, thereby becomes the owner of it; the act of occupying or holding in actual as distinguished from constructive possession. Formerly, when a man held land pur autre vie (for the life of another), and died before that other, as his estate could not descend to his heir nor revert to the donor until the determination of the specified life, it was considered to belong of right to the first who took possession of it for the remainder of the life, and such possession was termed *general occupancy*. And when the gift was to one and his heirs for the life of another, the heir was said to take as *special occupant*. As the law now stands, however, a man is enabled to devise lands held by him pur autre vie, and if no such devise be made, and there be no special occupant, it goes to his executors or administrators.

As we before observed that occupancy gave the right to the temporary use of the soil, so it is agreed upon all hands that occupancy gave also the original right to the permanent property in the substance of the earth itself; which excludes every one else but the owner from the use of it. *Blackstone*, Com., II, 1.

2. The term during which one is an occupant: as, during his occupancy of the post.

occupant (ok'ü-pänt), *n.* [*< F. occupant*, < *L. occupant*(*t*), pp. of *occupare*, occupy: see *occupy*.] 1. One who occupies; an inhabitant; especially, one in actual possession, as a tenant, who has actual possession, in distinction from the landlord, who has legal or constructive possession.

In regard to what a person does as a regular work or a means of earning a livelihood, *occupation* is that which occupies or takes up his time, strength, and thought; *calling* and *vocation* are high words, indicating that one is called by Providence to a particular line of work; *calling* is Anglo-Saxon and familiar, and *vocation* is Latin and lofty (the words are not always used in the higher sense of divine appointment or the call of duty, but it is much better to save them for the expression of that idea); *employment* is essentially *business* as *occupation*; *pursuit* is the line of work which one pursues or follows; *business* suggests something of the management of buying and selling; *trade* and *profession* stand over against each other for the less and more intellectual pursuits, as the *trade* of a carpenter, the *profession* of an architect; *trade* is different from a *trade*, the latter being skill in some handicraft, as, being obliged to learn a trade he chose that of a blacksmith; the "learned professions" used to be law, medicine, and the ministry, but the number is now increased; *craft* is an old word for a *trade*; *office* suggests the idea of duties to be performed for others. See *vocation*, 5.

All their causes, differences, variances, controuersies, quarrels, and complaints, within any our realmes, domini-

ference in specific gravity of the two. As the result of this, it is found that the temperature of the ocean as a rule diminishes as greater depths are attained, and that the deeper parts, where open to the general circulation, are near the freezing-point. A remarkable feature of the ocean-water is the uniformity in the nature and quality of the salts which it contains, provided the specimen has been taken at considerable distance from land. The weight of the salts held in solution by the main ocean is about 34 per cent. of the whole; of this about three quarters is common salt, one tenth chlorid of magnesium, one twentieth sulphate of magnesia, about the same sulphate of lime, one twenty-fifth chlorid of potassium, and a little over one per cent. bromide of sodium. Other substances are also present in smaller quantity, making in all about twenty elements which have been detected in the ocean-water; many of these, however, exist only in very minute traces. The economical value of the ocean as a source of supply for common salt is considerable; but the quantity thus obtained is not so great as that furnished by mines of rock-salt or by the evaporation of brine got by boring. See salt.

As defined by Coes, it is restricted to

The term *oceanography* is little used in English except by writers translating from the German, who prefer *oceanography* to *thalassography*, while the best authorities writing in English at the present time use *thalassography*, which is a designation of that special branch of physical geography which relates to the ocean and its phenomena.

ocellar (ô-sel'âr), a. [*NL. ocellaris*, < *L. ocellus*, a little eye: see *ocellus*.] Of or pertaining to ocelli; ocellate.—*Ocellar structure*, the name given by Rosenbusch to a peculiar aggregation of mineral forms, chiefly microscopic in size, in which the individual components are arranged in rounded (ocellar) forms, or aggregated in branching, fern-like groups, which are sometimes tangential and sometimes radial to the central individual. This structure is most characteristically developed in the leucitophytes. Also called *centric structure* by some English lithologists, by whom this term is used rather vaguely, sometimes as nearly the equivalent of *micropegmatitic*.

The structures which especially distinguish these granophytic rocks are the micropegmatitic, the centric or ocellar structure, the pseudoperthitic, the microgranitic, and the drusy or microlitic structures.

The back of the ear is usually black and white, and the tail is half-ringed with black. The common name of an important

class of natural earths consisting of mixtures of the hydrated sesquioxides of iron with various earthy materials, principally silica and alumina. These mixtures occur in many localities and have many shades of color, among which tints of red, reddish brown, yellow, and orange are most common. They form a series of valuable and important pigments, used extensively alike by house-painters and artists both in oil and in water-colors. The most usual and common type of ochre-color is a yellow turning neither to red on the one hand nor to brown on the other, but its tone is not as brilliant nor as pure as chrome-yellow. (For varieties, see below.) Ochres in general have much body and are very permanent. Most ochres on burning become redder and darker. Raw sienna and raw umber are varieties of ochre. 2. Money, especially gold coin: so called in allusion to its color. [Slang.]

If you want to cheek us, pay your ochre at the doors.

As a mineral it designates a soft earthy variety of hematite. — **Roman ochre**, a pigment of a rich, deep, and powerful orange-yellow color. It is used, both raw and burnt, in oil and water-color painting, and is transparent and durable. — **Scarlet ochre.** See *red ochre*. — **Stone ochre.** Same as *Oxford ochre*. — **Transparent gold ochre**, an ochre tending toward raw sienna but more yellow in tone. — **Tungstic ochre.** See *tungstic*.

Cf. *outas*.] I. *n.* 1. (a) The eighth day from a festival, the first-day itself being counted as the first: as, Low Sunday is the *octave* of Easter. The octave necessarily falls on the same day of the week as the feast from which it is counted.

The octave of the consecration-day had barely passed, and there was already a king to be buried.

E. A. Freeman, *Norm. Conq.*, III. 17.

(b) The prolongation of a festival till the eighth day inclusive; a period consisting of a feast-day and the seven days following: as, St. John the Evangelist's day (December 27th) is within the octave of Christmas. See *outas*.

Holinshed, Hen. III., an. 1225.

Jer. Taylor, *Works* (ed. 1835), I. 63.

2. In music: (a) A tone on the eighth diatonic degree above or below a given tone; the next higher or lower replicate of a given tone. (b) The interval between any tone and a tone on the eighth degree above or below it. (c) The harmonic combination of two tones at the interval thus described. (d) In a scale, the eighth tone from the bottom, or, more exactly, the tone with which the repetition of the scale begins; the upper key-note or tonic; the eighth: solmized *do*, like the lower key-note. The typical interval of an octave is that between any tone and its next replicate, which is acoustically represented by the ratio 1:2—that is, in number of vibrations—and is equal to six diatonic whole steps or to twelve semitones. Such an octave is called *perfect* or *major*; an octave one half-step shorter is called *diminished* or *minor*; an octave one half-step longer is called *augmented*. The perfect octave is the most complete consonance after the unison. Indeed, its completeness is often regarded as belonging to a different category from that of the other perfect consonances, except the unison, since it amounts rather to a repetition or reinforcement of the original tone at a higher or lower pitch than to a combination of a new or different tone with it: hence the term *replicate*. In harmony the parallel motion of two voice-parts in perfect octaves is forbidden, except where the mere reinforcement of one voice by another is desired: such octaves are called *consecutive octaves*. See *consecutive intervals*, under *consecutive*. (e) In a standard system of tones selected for artistic use, a division or section or group of tones an octave long, the limits of which are fixed by reference to a given or assumed standard tone whose exact pitch may be defined. The tone usually assumed as a starting-point is middle C (written on the first ledger line below in the treble clef, and on the first above in the bass clef). The octave beginning on the next C below is called the *tenor* or *small octave*; that beginning on the second C below is called the *bass* or *great octave*; that beginning on the third C below is called the *contrabass octave*; while that beginning on middle C itself is called the *alto*, *once-marked*, or *once-accented octave*; that beginning on the next C above is called the *treble*, *twice-marked*, or *twice-accented octave*, etc. See the accompanying table:

The acceptance of the octave as the best unit for thus dividing the series of recognized tones into sections of equal length and value has not been uniform. Ancient Greek music seems to have first used the tetrachord as such a unit; while medieval music employed the hexachord in the same way. The subdivision of the octave portions themselves has also varied greatly in different systems of music. See *scale*. (f) In organ-building, a stop whose pipes give tones an octave above the normal pitch of the digitals used; specifically, such a stop of the diapason variety. Also known as the *principal*. Also called *octave-flute*, *octave-stop*.—3. Any interval resembling the musical octave in having the vibration-ratio of 1:2.

If . . . the solar spectrum be considered in its whole extent, we find in the ultra-red alone, according to Müller, more than two octaves, to which must be added more than another octave from A to the line B in the ultra-violet. The whole length of the solar spectrum thus embraces consequently about four octaves.

4. A small cask of wine containing the eighth part of a pipe.—At the octave, all' ottava, *sya*, in musical notation. See *ottava*.—Broken octaves, in piano-

forte and organ music, a passage of octaves the two tones of which are played successively instead of together: as,

Covered or hidden octaves, in music, the consecutive octaves that are suggested when two voices proceed in similar (not parallel) motion to a perfect octave. Hidden octaves are forbidden in strict counterpoint, and discountenanced in simple harmony, particularly if both voices skip. Compare *hidden fifth*, under *fifth*.—Rule of the octave, in the musical theory of the seventeenth and eighteenth centuries, an arbitrary and imperfect scheme of the harmonies proper to the successive tones of the scale. The modern theory that every tone of the scale may be made the basis of a triad has completely displaced this rule.—Short octave, in early organ-building, the lowest octave of the keyboard when made to consist of only three or four of the digitals most used in the music of the day, instead of the full number. The digitals were sounded together, as if belonging to the regular series. This curtailment was simply to avoid the expense of large pipes.

octavo (ok-tā'vō), *a.* and *n.* [*Prop.* (as an adj.) in *octavo* (as in *F. Sp.*), being a NL phrase: see *in*, in; *octavo*, abl. of *octavus*, eighth: see *octave*. Cf. *duodecimo*, *folio*, *quarto*, etc.] I. *a.* Having eight leaves to a sheet; formed of sheets of paper so folded as to make eight leaves to the sheet: as, an *octavo* volume.

II. *n.* A book or pamphlet every section or gathering of which contains eight leaves, each leaf supposed to be one eighth of the sheet printed; usually written 8vo. When the name of the paper of which the book is made is not specified, an *octavo* is understood as a medium octavo, 6 × 9 1/2 inches. Smaller octavos are—post 8vo, 5 1/2 × 8 1/2 inches; demy 8vo, 5 1/2 × 8 inches; crown 8vo, 5 × 7 1/2 inches; cap 8vo, 4 1/2 × 7 inches. Larger octavos are—royal 8vo, 6 1/2 × 10 inches; super-royal 8vo, 7 × 11 inches; imperial 8vo, 8 1/2 × 11 1/2 inches. These are regular sizes of paper in the United States. Publishers and booksellers describe as octavos only those books or leaves that are larger than 5 1/2 × 8 and smaller than 7 1/2 × 11 1/2 inches, irrespective of the number of leaves in a section, which may be twelve or sixteen on thin paper and four or six on thick paper. Larger sizes are described as 4to, smaller sizes as 12mo or 16mo. Bibliographers, as a rule, limit the use of the word *octavo* to books having sections of eight leaves or sixteen pages.

3. Used absolutely: (a) One who holds a commission in the army or navy. In the army general officers are those whose command extends to a body of forces composed of several regiments, as generals, lieutenant-generals, major-generals, and brigadiers. *Staff-officers* belong to the general staff, and include the quartermaster-general, adjutant-general, aides-de-camp, etc. *Commissioned officers*, in the British army, include colonels, lieutenant-colonels, and majors (*field-officers*), and captains, lieutenants, and sub-lieutenants (*company officers*), and are appointed by a commission from the crown or from a lord lieutenant; in the United States army these hold their commissions from the President, the lowest grade being that of second lieutenant. *Brevet officers* are those who hold a nominal rank above that for which they receive pay. *Non-commissioned officers* are usually appointed by the commanding officers of the regiments, and are intermediate between commissioned officers and private soldiers, as sergeant-majors, quartermaster-sergeants, sergeants, corporals, and drum and fife-majors. Officers in the navy are distinguished as *commissioned officers*, holding their commissions in the British navy from the lords of the Admiralty and in the United States navy from the President; *WARRANT OFFICERS*, holding warrants in the British navy from the Admiralty, and in the United States navy from the Secretary of the Navy; as boatswains, gunners, carpenters, and sailmakers; and *petty officers*, appointed by the captain or officer commanding the ship. Officers in the navy are also classed as *line or combatant officers*, and *staff or non-combatant officers*, the latter comprising paymasters, and medical, commissariat, and other civil officers. See *time*, 14. (b) In the law of corporations, one who holds an office, such as a director or cashier, as distinguished from one who is an employee, as a bookkeeper. It is disputed whether a bank-teller is properly included in the designation of officers or not. The question would often be determined by a reference to the charter or by-laws of the particular bank. More specifically, an officer is an executive officer, such as the president, secretary, or treasurer, as distinguished from a member of the board of directors or an employee. (c) A policeman, constable, or beadle.

It is no soleism to call a police-constable an officer, although the chief constable would speak of him as one of his "men." A police-constable is a peace officer, with the rights and duties of such, and is therefore entitled to be styled an officer.

inventor named *Ogam*, whose name is reflected
in the W. *ofydd* (> E. *ovate*), a man of letters or
science, philosopher, and in the Gr. *Ὀγυγος*, the
name, according to Lucian, of a deity of the
Gauls, represented as an old man who drew after
him a crowd of followers by means of chains
connecting their ears with the tip of his tongue,
i. e. by power of speech: prob. (Rhys) orig. =

character belonging to an alphabet of 20 letters
used by the ancient Irish and some other Celts in

fined to the one or to the other side of this stem or inter-
secting it. Some of the lines make an acute angle with
the stem. Curves rarely occur. The oghams were cut on
or carved on wood or stone, and some have come down to
us in manuscripts. In lapidary oghamic inscriptions the
edge of the stone often served as the main stem. Oghams
continued to be used till the ninth or tenth century in
Ireland as secret characters.

2. An inscription consisting of such characters.

Here he cut four wands of yew, and wrote or cut an
Ogham in them; and it was revealed to him, "through his

O'Curry, Ancient Irish, I. ix.

3. The system of writing which consisted of
such characters.

There is, however, a notion that the *Ogham* was essentially
pagan, but in reality it was no more so than the Roman
alphabet. J. Rhys, Lect. on Welsh Philology, p. 353.

The *Ogham* writing, as I have elsewhere shown, was
simply an adaptation of the runes to xylographic conve-
nience, notches cut with a knife on the edge of a squared
staff being substituted for the ordinary runes.
Isaac Taylor, The Alphabet, II. 225.

oil-distributor (oil'dis-trib'ü-tär), *n.* Any device or appliance used for the distribution of oil over the surface of the sea for smoothing waves and thus obviating their destructive effect. The first appliance for this purpose, which aimed at economy in the use of oil, was a porous oil-bag attached to a rope, thrown overboard, and towed from the end of a spar or out-

rigger, the oil slowly filtering through the pores. This has been followed by a variety of inventions, comprising oil-bags placed in water-closet pipes, and devices for distributing oil when towed by a vessel. The oil-distributor of M. Gaston Menier employs a pump discharging water at the water-line, through a series of outboard pipes, the pump also taking oil from a receptacle, and mingling it with the water discharged. The rate of expenditure of oil is indicated by a glass gauge, and is regulated by a valve. The oil-distributor of Captain Townsend of the United States Signal Office consists of a hollow metal globe ten inches in diameter, which holds about 1½ gallons of oil, and is kept afloat and held in a nearly fixed position relatively to the surface of the water by an air-chamber. The oil-chamber has an upper and a lower valve, both of which may be adjusted to permit water to flow in through the lower, and the oil displaced by the water to flow out through the upper valve, at a rate controlled by the adjustment. The oil acts mechanically by spreading over the surface of the sea in a tenuous film, which is sufficient to prevent the waves from breaking, and this takes from them their chief power for harm.

The fat is first carefully cleaned from adhering impurities, as bits of flesh, etc., and then thor-

oughly washed in cold water. It is next rendered at a temperature of 130° to $175^\circ F$, and the mixture of oily products thus obtained is slowly and partially cooled, till a part of the stearin and palmitin has crystallized out. Under great hydraulic pressure the parts which still remain fluid are pressed out; after a time these solidify, and are ready for market. This substance has been largely used as an adulterant of butter. When oleomargarin is churned in a liquid state with a certain proportion of fresh milk, a butter is produced which mixes with it, while the buttermilk imparts a flavor of fresh butter to the mass, making so perfect an imitation that it can scarcely be distinguished by taste from fresh butter. A refined fat strongly resembling that obtained from beef-fat is got from lard by similar treatment. Also, in commerce, called simply *oleo*.

A shorter movable cylinder, made of the odoriferous substance, fits over the straight end of this glass tube. The lobe is primitively hollow, being a tubular process whose cavity is continuous with that of the proencephalic ventricle, and it is of much greater relative size in the lower than in the higher vertebrates. In the latter the olfactory lobes are reduced to a pair of solid flattened bands, like bits of tape, and improper to receive the olfactory nerves, which properly applies only to the numerous filaments arising from the bulbous end of the so-called olfactory nerves, penetrating the cribriform plate of the ethmoid bone through numerous minute foramina, and ramifying through the Schneiderian mucous membrane of the nose. *See also* *Olfactive*. above and silvery beneath; the general effect is that of an old willow. It is an evergreen, of great longevity and productiveness, and thrives in poor and dry calcareous and sandy soils. Of the cultivated variety (*O. sativa*) some twenty or thirty subvarieties are recognized. The wild variety (*O. =*Syn.* *Omen*, *Portent*, *Sign*, *Presage*, *Prognostic*, *Augury*, *Foreboding*. *Omen* and *portent* are the most weighty and supernatural of these words. *Omen* and *sign* are likely to refer to that which is more immediate, the others to the more remote. *Omen* and *portent* are external; *presage* and *foreboding* are internal and subjective; the others are either internal or external. *Sign* is the most general. *Prognostic* applies to the prophesying of states of health or kinds of weather, and is the only one of these words that implies a

deduction of effect from the collation of causes. *Presage* and *augury* are generally favorable, *portent* and *foreboding* always unfavorable, the rest either favorable or unfavorable. *Omen* and *augury* are most suggestive of the ancient practice of consulting the gods through priests or augurs. *A foreboding* may be mistaken; the others are presumably correct. All these words have considerable freedom in figurative use. See *foretell*, *v. t.*

An omentum is a structure similar to a mesentery, and is in fact a special mesentery connecting the stomach with the liver, spleen, and colon respectively. Hence omenta are commonly distinguished by name. The *gastrohepatic* or *lesser omentum*, *omentum minus*, is a single fold (two layers) of peritoneum extending between the transverse fissure of the liver and the lesser curvature of the stomach. Between the two layers are the hepatic artery, portal vein, bile duct, and associate structures, bound together in a quantity of loose connective tissue forming Glisson's capsule. The *gastrosplenic omentum*, of two layers, connects the concavity of the spleen with the fundus of the stomach, and contains the splenic vessels. The *gastrocolic* or *great omentum*, *omentum majus*, also called *epiploon*, is the largest of all the peritoneal duplications, and consists of four layers of peritoneum attached to the greater curvature of the stomach and to the transverse colon, whence it is looped down freely upon the intestines, forming a great flap or apron.

III. *pron.* 1. A single person or thing; an

individual; a person; a thing; somebody; some

one; something. It is used as a substitute for a noun

designating a person or thing, and is in so far of the nature

of a personal pronoun, but is capable, unlike a personal

pronoun, of being qualified by an indefinite article, an

adjective, or other attributive: as, *such* a one, *many* a one,

a good one, each one, *which* one. It is used in the plural

also: as, I have left all the bad ones.

Thou thoughtest that I was altogether such an one as

thyself. Ps. l. 21.

Both were young, and one was beautiful.

Byron, The Dream, ii.

The most frequent constructions of *one* are—(a) As an-

to *any person* who, or to *he* who, *she* who, without dis-

tinction of gender.

Named softly as the household name of *one* whom God hath

taken. Mrs. Browning, Cowper's Grave.

ing its repetition: as, here are some apples; will you take

one? This portrait is a fine one.

my mighty ones for mine anger. Isa. xiii. 3.

We poor ones love, and would have comforts, sir,

As well as great. Fletcher and Rowley, Maid in the Mill, v. 2.

(d) It easily passes, however, from the meaning 'any one'

into the collective sense of 'all persons,' 'people generally,'

and for this can be substituted *people*, *they*, *we* (if the

speaker does not except himself from the general state-

ment), *you* (the person addressed being taken as an ex-

ample of others in general), or the impersonal *passive* may

be substituted: as, *one* cannot be too careful (we cannot,

you cannot, *they* cannot, *people* cannot be too careful); *one*

knows not when (it is not known when). *One* is sometimes

virtually a substitute for the first person, employed by a

speaker who does not wish to put himself prominently for-

ward; as, *one* does not like to say so, but it is only too true;

one tries to do *one's* best. *One's self* or *oneself* is the cor-

responding reflexive: as, *one* must not praise *one's self*.

One would think it were Mistress Overdone's own house.

Shak., M. for M., iv. 3. 8.

One would not, sure, be frightful when *one's* dead.

of the preposition: as, they looked at *one another* (one looked

at *another*); they threw stones at *one another* (one threw

stones at *another*); the storm beats the trees against *one*

another (beats one against *another*).]

It is a biennial herbaceous plant with long tubulated leaves, and a swelling pithy stalk. The bulb is composed of closely concentric coats (tunicated), and, with situation and race, varies much in size, in color, which runs from dark-red to white, and in the degree of the characteristic pungency, which is greater in the small red onions than in the larger kinds. The raw onion has the properties of a stimulant, rubefacient, etc., and is wholesome in small quantities. These properties and its pungency depend upon an acrid volatile oil which is expelled by boiling. The native country of the onion is unknown. It has been in use from the days of ancient Egypt, and is said to be more widely grown for culinary purposes than almost any other plant. It endures tropical heat and the coolest temperate climate. Its varieties are very numerous. The onions of Italy, Spain, Mexico, California, and the Bermudas are specially noted for size and quality.

oölite (ō'ō-lit), *n.* and *a.* [*Gr.* *φών*, an egg, + *λίθος*, a stone.] 1. *n.* A granular limestone each grain of which is more or less completely spherical, and made up of concentric coats of carbonate of lime formed around a minute nucleus, which is usually a grain of sand: so called from the resemblance of the rock to the roe of a fish. The term *oölite* gave the name to an important series of fossiliferous rocks—the Oölite of England and the Jurassic of Continental and American geologists. *Oölitic* as thus employed is, however, obsolescent in England. The series was called *oölitic* from the fact that it is largely made up of limestone having that peculiar structure. The following are the generally recognized subdivisions of the Oölite or Jurassic system in England: the Upper or Portland Oölite, comprising the Furberian, Portlandian, and Kimmeridgian; the Middle or Oxford Oölite, comprising the Corallian and Oxfordian; and the Lower or Bath Oölite, comprising the Great Oölite group, the Fuller's Earth, and the Inferior Oölite. opera¹ (ôp'ê-râ), *n.* [= *OF. opéra* = *Sp. Pg. opera* = *D. opera* = *G. opera* = *Sw. Dan. opera*, < *It. opera*, an opera, orig. composition as opposed to improvisation, < *L. opera*, *f.*, work, connected with *opus* (*oper-*), neut., work, toil: see *opus*.] 1. A form of extended dramatic composition in which music is an essential and predominant factor; a musical drama, or a drama in music. The opera is one of the chief forms of musical art; many grounds it is claimed to be the culminating musical form. At least it affords opportunity for the application of nearly every known resource of musical effect. Its historical beginning was doubtless in the musical declamation of the Greeks, especially in connection with their dramatic representations. The idea of a musical drama was perpetuated during the middle ages under the humble guise of mysteries or miracle-plays, in which singing was an accessory. The modern development began in Italy near the close of the sixteenth century, when an attempt was made to revive the ancient melodic declamation, an attempt which led directly to the discovery and establishment of monody and harmony in the place of the medieval counterpoint and the arias and the arias as definite methods of composition, and of instrumentation as an independent element in musical works. The mod-

ern opera involves the following distinct musical constituents combined in various ways: (a) recitatives, musical declamations, mainly epic or dramatic in character, with or without extended accompaniment; (b) *arias*, *duets*, or *trios*, melodies for one, two, or three voices, constructed in a more or less strict musical form, predominantly lyrical in character, and usually with carefully elaborated accompaniments; (c) *choruses* and *concerted numbers* of various forms, in which dramatic elements are generally predominating, and which are often wrought into noteworthy climaxes of great musical and dramatic interest; (d) *instrumental elements*, including both accompaniments and independent passages, the former varying from the merest harmonic groundwork for declamation to a detailed instrumental commentary upon the dramatic actions and situations as they transcend each other, and the latter including choruses, interludes, marches, dances, etc., which either introduce, connect, supply, or embellish the links in the chain of dramatic incident. To these may be added dancing, or the ballet, which is introduced either as an incidental diversion or as a component part of the dramatic action itself. In the older operas the successive numbers or movements are sharply separated from each other, while in recent ones the action is continuous except at one or two principal points. In Italy the opera has had an unbroken course of development since before 1600. It began to be diligently cultivated in France and Germany about 1650, and in England somewhat later. Every leading modern composer, except Mendelssohn, has contributed more or less to its literature. Modern operas have tended toward a lyrical extreme, to the neglect of dramatic consistency and truth, while German operas have strongly emphasized the romantic and strictly dramatic elements. French operas have often sought much for comic or spectacular effects. The Wagnerian theory of the opera presents some peculiarities, especially in the obliteration of the distinction between the dramatic and the musical, and in the remarkable elaboration of the orchestral effects, and in the unification of the poetic, musical, dramatic, and scenic elements, though these characteristics were foreshadowed in the works and theories of earlier masters. The maintenance of expensive opera-houses, with regular seasons of performances annually, is a matter of governmental appropriation in Germany, France, and other countries. The opera has thus become a powerful factor in the social and artistic life of many cities. Operas are often described by such qualifying terms as *grand* or *serious*, *dramatic*, *comic*, etc. Grand operas have an elaborate plot, and the entire work is set to music; while comic operas frequently contain spoken dialogue. In common speech, *German opera* means opera in German, *Italian opera* in Italian, etc. A *ballad-opera* is a light dramatic work into which ballads or popular songs are arbitrarily introduced.

An *Opera* is a poetical tale or fiction, represented by vocal and instrumental music, adorned with scenes, machines, and dancing. Dryden, *Albion and Albanus*, Pref.

The principles of construction are various. A common form has a ratchet-wheel connected with registering-dials, and an oscillating lever which by suitable mechanism is made to take up a single ratchet-tooth at each to-and-fro movement of a reciprocating or oscillating part, such as the cross-head of a steam-engine. Another form has a spear-pointed spindle which is connected with a registering mechanism, the whole implement being held in the right hand, and the point of the spindle being pressed into the center at the end of the shaft whose revolutions are desired to be counted. The form is often slenderer than in a common eel; the posterior nostrils are labial—that is, on the margin or even the inside of the upper lip; and the tongue is attached to the floor of the mouth. In some species the tail is conical or finless; in others it is surrounded by a fin, as usual in eels, whence the two subfamilies *Ophichthyinae* and *Myrinae*. Several genera are found in the waters of the southern and Pacific coasts of the United States.

opicleide (ô-fik-lid), *n.* [*< Gr. ôphis*, a serpent, + *kleis* (κλει-), a key: see *clavis*.] A metal musical wind-instrument, invented about 1790, having a large tube of conical bore, bent double, with a cupped mouth-piece.

It is essentially a development of the old wooden serpent, and has sometimes been made partly of wood; it is the bass representative of the keyed-bugle family. The tones produced are the harmonics of the tube, as in the horn; but the fundamental tone may be altered by means of keys which control vents in the side of the tube. Eleven such keys are employed, so that the entire compass is over three octaves, beginning (in the usual bass variety) on the third B below the middle C, with all the semitones—all obtainable with exceptional accuracy of intonation. Its resources are therefore considerable, and as its tone is highly resonant and pungent it is an important orchestral instrument. The alto opicleide is pitched a fifth higher than that described above, while lower varieties also occur.

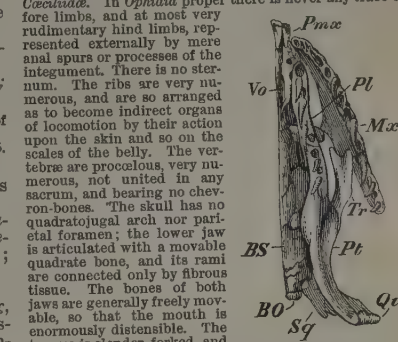

opicleidist (ô-fik-lid-ist), *n.* [*< opicleide* + -ist.] A performer on the opicleide.

Ophideres (ô-fid'ê-rêz), *n.* [NL. (Boisduval, 1832), prop. **Ophideres* (cf. Gr. *ôphideiros*, serpent-necked), < *ôphis*, a serpent, + *êron*, Attic *êron*, neck, throat.] The typical genus of *Ophideridae*, having the palpi spatulate or clavate, and the hind wings luteous. It is very widely distributed in both hemispheres; the species are large and often beautifully colored. *O. fulvica* of South Africa damages

oranges by piercing them with its haustellum and sucking the juice.

Ophideridae (ô-fi-der'î-dê), *n.* *pl.* [NL. (Guenée, 1852), < *Ophideres* + -idae.] A family of noctuid moths of large size and striking coloration, represented by *Ophideres* and five other genera in nearly all faunas except the European.

Ophidia (ô-fid'î-â), *n.* *pl.* [NL., pl. of **ophidium*, < Gr. *ôphidion*, dim. in form, but not in sense, of *ôphis*, a serpent; or impropr. for **Ophioidea*, < Gr. *ôphis*, a serpent, + *eidôs*, form.] An order of the class *Reptilia*, without developed limbs, with mobile quadrate bone and separate mandibular ramus; the snakes or serpents. The name was introduced to replace *Serpentes* of Linnaeus, and at first included not only serpents in a proper sense, but certain footless lizards, and even the amphibians of the family *Ceciliidae*. In *Ophidia* proper there is never any trace of fore limbs, and at most very rudimentary hind limbs, represented externally by the anal spurs or processes of the integument. There is no sternum. The ribs are very numerous, and are so arranged as to become indirect organs of locomotion by their action upon the skin and so on the scales of the belly. The vertebrae are procoelous, very numerous, not united in any sacrum, and bearing no chevrons. The skull has no quadratojugal arch nor parietal foramen; the lower jaw is articulated with a movable quadrate bone, and its rami are connected only by fibrous tissue. The bones of both jaws are generally freely movable, so that the mouth is easily articulated with the tongue. The tongue is slender, forked, and protrusile, subserving a tactile office. Teeth are present in one or both jaws, usually in both; they are numerous and sharp, and in venomous *Ophidia* some of the upper ones, usually a single pair, are enlarged, hooked, grooved, or apparently perforate, and thus converted into poison-fangs. The eyes have no movable lids, the cuticle extending directly over the eyeball. The cuticle is scaly, forming many very regularly arranged rows of scales on the upper parts, and usually larger modified scales on the under side, called *gastrætes* and *urogastrætes*, serving to some extent for locomotion. There is a pair of extracloacal penes in the male; the female is oviparous or ovoviviparous. *Ophidia* are variously subdivided—by Duméril and Bibron into *Ophiderontia*, *Aphylogontia*, *Proteroglypha*, and *Solenoglypha*, an arrangement substantially now current, though with some modifications. Cope's latest arrangement is *Epanoste*, *Catodonta*, *Tortricina*, which are opoterodont, *Asina*, which are aglyphodont, *Proteroglypha*, and *Solenoglypha*. There are 20 families and about 800 genera, of which more than 200 belong to the family *Colubridae* alone. See also cut under *Python*.

ophidian (ô-fid'î-an), *a.* and *n.* [*< Ophidia* + -an.] 1. *a.* Having the nature or characters of a snake or serpent; belonging or relating to ophidians; or of pertaining to the *Ophidia*. Also *ophidianous*.

II. *n.* A member of the *Ophidia*, as a snake or serpent.

There is but one species, *O. paradoxum*, the snake-tree, native in Guiana, a lofty tree bearing alternate pinnate leaves, panicles of many very small flowers, and roundish one-seeded drupes containing a spirally twisted snake-like embryo. The natives are said to believe that these are transformed into venomous serpents.

Ophiocephalidae (of-i-ō-se-fal'i-dē), *n.* pl. [NL., < *Ophiocephalus* + *-idae*.] A family of fishes, typified by the genus *Ophiocephalus*, the walking-fishes. They have a long subcylindric body covered with small scales, and a snake-like head shielded on top with large scales, a long spineless dorsal fin, and usually six-rayed thoracic ventrals. These remarkable fishes breathe air by means of an air-chamber developed over the gills, and die if they breathe water too long. They live in holes in the banks of rivers and pools, similar wet places, and often burrow in the mud. There are 25 or 30 species, natives of the fresh waters of the East Indies and Africa, and some attain a length of from 2 to 4 feet. They are able to survive droughts, living in semi-fluid mud or lying torpid below the hard-baked crust of a tank or pool from which every drop of water has dried up. Respiration is probably suspended during this torpidity, but while the mud is still soft enough to let them come to the surface they rise at intervals to breathe air. This faculty of aerial respiration is due to the development of the accessory branchial chamber; there is, however, no accessory branchial organ, and the opening of the cavity is partly closed by a fold of mucous membrane.

The species are natives of the East. They are furnished with a cavity to supply water to the gills, and are able to live a long time out of water, and often travel considerable distances from one pool to another. The *O. gachua* (the *coranota* or *gachua* of India) is much used for food by the natives. It is generally brought to market and cut up for sale while living. Also, *improperly*, *Ophiocephalus*. [NL., < *Ophioglossum* + *-aceae*.] A small but very well-defined group of vascular cryptogamous plants, by some systematists regarded as an anomalous section of the ferns, by others considered as a group of equal taxonomic rank with the true *Filices*, the *Equisetaceae*, *Lycopodiaceae*, etc. The prothallium is formed of parenchymatous tissue, and is destitute of chlorophyll, being developed underground;

the leaves are not circinate in vernation, and the sporangia, which are endogenous in their origin and without annulus, are never borne on the under side of the green frond. They differ further from the true ferns by the absence or imperfect formation of bundle-sheaths and sclerenchyma in the stems and leaves. The *Ophioglossaceae* embrace 3 genera, *Ophioglossum*, *Helminthothachys*, and *Botrychium*.

For a single description of negro ophiolatri may be cited Bosman's description from Whydah in the Bight of Benin; here the highest order of deities were a kind of snakes which swam in the villages, reigned over by that huge chief monster, uppermost and greatest and as it were the grandfather of all, who dwelt in his snake-house beneath a lofty tree, and there received the royal offerings of meat and drink, cattle and money and stuffs.

E. B. Tylor, *Frim. Culture*, II. 212.

The antennae are as long as the body, the abdomen is compressed, and the color is usually honey-yellow. *O. macrurus* infests the American silkworm, *Telescoparia polyphemus*. The female lays one egg in the body of the silkworm, which latter lives till it is full-grown and spins its cocoon, but then dies without pupating. *O. praxitrus* infests the common army-worm, or larva of *Leucania unipuncta*.

Ophionidae (of-i-on'i-dē), *n.* pl. [NL., < *Ophion* + *-idae*.] A family of ichneumonid-flies, typified by the genus *Ophion*. Shuckard, 1840.

It is chiefly characterized by the compressed, usually petiolate abdomen and short ovipositor. It includes about 50 genera besides *Ophion*, and many hundred species. All are parasitic upon other insects, and some feed externally upon their hosts. About 400 are catalogued as European, and 250 are described for the United States.

Ophiophagus (of-i-ō-f'ā-gus), *a.* [< NL. *Ophiophagus*, < Gr. *ὄφις*, serpent-eating, < *φάγω*, eat.] Eating or feeding upon serpents; reptilivorous.

Nor are all snakes of such imposing qualities as common opinion presumeth: as is confirmable from the ordinary green snake with us, from several histories of domestic snakes, from *Ophiophagus* nations, and such as feed upon serpents. Sir T. Browne, *Vulg. Err.*, vi. 22.

Ophiophagus (of-i-ō-f'ā-gus), *n.* [NL., < Gr. *ὄφις*, serpent-eating: see *Ophiophagus*.] A genus of very venomous serpents of the family *Elapidae*, or of the restricted family *Naja*. It is a kind of cobra, very closely related to *Naja*, the chief technical distinction being the presence of postparietal plates on the head. *O. elaps*, the hamadryad, is one of the largest and most deadly of serpents; it is said to attain a length of nearly 12 feet, and is said to reach 15 feet. Its bite is fatal to man in a few moments, and it is said to be able to kill very large quadrupeds. This serpent is found in India and some of the East India islands, as Java, Sumatra, and Borneo, but is fortunately not so common as the ordinary cobra. The generic name refers to its habit of feeding upon other snakes.

Ophiopogon (of-i-ō-pō'gon), *n.* [NL. ophite¹ (of'it), *a.* [*Gr.* *ὄφις*, of or like a serpent, < *ὄφις*, a serpent.] Pertaining to a serpent.

ophite¹ (of'it), *n.* [*L.* *ophites*, also *ophitis*, serpentine stone, see *ophites*], < *Gr.* *ὄφις*, fem. *ὄφιν*, of or like a serpent: see *ophite*¹, *a.*] A name originally applied to certain eruptive (diabasic or doleritic) rocks occurring in the Pyrenees, and later used with similar meaning for rocks found in Spain, Portugal, and northern Africa. In many of these the augite has become converted into urtite, hence they had previously been often classed with the diorites. Michel Lévy divides the French ophites into two types, the first distinguished by the presence of large proportions of the augitic or urtite constituent, the second by a large predominance of plagioclase. The composition of the rocks which have been designated by different lithologists as *ophites* is variable, and their relations have not yet been fully worked out.

Ophite² (of'it), *n.* [*LL.* *Ophitea*, < *LGr.* *ὄφιν*, (also *ὄφινος*), pl., < *Gr.* *ὄφις*, of or pertaining to a serpent: see *ophite*¹, *n.*] A member of a Gnostic body, of very early origin, especially prominent in the second century, and existing as late as the sixth century. Its members were so called because they held that the serpent by which Eve was tempted was the impregnation of divine wisdom, the great teacher and civilizer of the human race. They were also called *Naassenes* (from Hebrew *nāchash*, a serpent), see *Sethian*.

ophites (ō-fi'tēz), *n.* [*L.*, < *Gr.* *ὄφις* (see *λίθος*), serpentine stone, so called, according to Pliny, because it is spotted like a snake, or, as was fancifully thought, because a person carrying it might walk among serpents with impunity: see *ophite*¹.] A stone mentioned by various Greek and Latin authors, the word designating several quite different things. It is impossible to identify with certainty any one of the various substances, some of which were unquestionably fabulous, to which the name *ophites* was given by Orpheus, Dioscorides, Pliny, and other classic writers. Pliny distinguishes two kinds of ophite, the hard and the soft. The former may have been some variety of granite; the latter, a variety of serpentine, perhaps the Tuscan gabbro or ophiolite. From a very early time, various rounded stones or petrifications, more or less egg-shaped in form, and called by various names, *ovum angustum*, *ophite*, *serpent-stone*, *adder-head*, *Druidical bead*, etc., have been held in high veneration, and endowed with extraordinary virtues. The ovum angustum described by Pliny would appear from his description to have been a fossil echinoderm. Glass spindle-whorls, which are known to have been in use within the past four hundred years, have been sold at a recent day as the great ovum angustum; and fossil echinoderms have also been within a few years treasured as Druidical relics, and regarded as possibly possessing a portion, at least, of the virtues attributed by the ancients to the ophites.

ophitic (ō-fi'tik), *a.* [*Gr.* *ὄφις* + *-itic*.] An epithet applied by various lithologists to a structure, especially characteristic of certain diabases and dolerites, in which the augitic constituent is separated into thin plates by interposed lath-shaped crystals of plagioclase, although the identity of the augite crystal is not lost, as is shown by the similar optic orientation of the separated portions.

Ophiuchus (of'i-ū'kus), *n.* [*L.*, < *Gr.* *ὄφις* + *χός* (tr. by L. *Anguitenens* as well as *Serpentarius*), a constellation so called, lit. 'holding a serpent,' < *ὄφις*, a serpent, + *ἔχω*, hold: see *hectic*.] An ancient northern constellation, representing a

Ophiuchus and Serpent.

man holding a serpent; the Serpent-bearer. Also called *Serpentarius*. The Serpent is now treated as a separate constellation.

Incensed with indignation, Satan stood
Unfettered, and like a comet burn'd,
That fires the length of *Ophiuchus* huge
In the arctic sky.
Milton, *P. L.*, ll. 709.

Ophiura (of-i-ū'ri), *n.* [*N.L.*, < *Gr.* *ὄφις*, serpent-tailed, < *ὄφις*, a serpent, + *οὐρά*, a tail.] A genus of sand-stars or brittle-stars, variously restricted by different authors. The term is used with great latitude of definition, and gives name to a family and to the whole order to which it belongs. In the late most restricted sense it is discarded, and *Ophiurina* is substituted, giving name to a family *Ophiurinae*.

ophiuran (of-i-ū'ran), *a.* and *n.* **I.** *a.* Of or pertaining to the genus *Ophiura* in any sense, or to the order *Ophiuroidea*.

II. *n.* A member of the *Ophiuroidea*.

ophiure (of-i-ū'r), *n.* [*N.L.* *Ophiura*.] An ophiuran.

Ophiuræ (of-i-ū'rē), *n. pl.* [*N.L.*, < *Ophiura* + *-æ*.] The simple-armed ophiurans, a division of ophiuroids contrasted with *Euryalæ* or those with branched arms.

Ophiuridae (of-i-ū'ri-dē), *n. pl.* [*N.L.*, < *Ophiura* + *-idae*.] A group of ophiurans. (*a*) In the widest sense, the whole order *Ophiuroidea*. (*b*) In a middle sense, the ordinary ophiurans with simple arms. (*c*) In the narrowest sense, the family represented by *Ophiura* or *Ophiurina*, and now called *Ophiurinae*. See cut under *Astrophyton*.

ophiuroid (of-i-ū'roid), *a.* and *n.* [*N.L.* *Ophiura* + *-oid*.] **I.** *a.* Ophiuran in the widest sense; of or pertaining to the order *Ophiuroidea*.

II. *n.* An ophiuran; any member of the *Ophiuroidea*.

Ophiuroidea (of'i-ū'roi-dē-ā), *n. pl.* [*N.L.*, < *Ophiura* + *-oidea*.] An order of echinoderms of the class *Stellerida* or starfishes, containing the brittle-stars, sand-stars, or ophiurans. They are starfishes with a more or less well-defined central disk distinct from and not passing into the arms or rays, and no anal orifice. The axis of the arms is composed of a series of calcareous ossicles called *vertebrae*, each of which is composed of two parts representing the ambulacral plates of ordinary starfishes, and the axis is covered with plates or with continuous integuments, usually bearing spines. The ambulacral nerve, water-vessels, and neural canal are within the hollow of the arm. The water-feet or pedicels are without suckers or ampullae, and protrude between the lateral plates of the arms. The mouth is pentagonal, and each angle is composed of five pieces. The order falls naturally into two leading divisions, according as the arms are simple or branched. These are sometimes called families, *Ophiuridae* and *Astrophytidae*; sometimes they are considered as suborders, when the former group is known as *Ophiurida* or *Ophiuræ*, and further subdivided into several families, of which the *Ophiuridae* proper constitute one. = *Syn.* The uses of *Ophiura* and its derivatives are almost inextricably blended; but in general (*a*) *Ophiuroidea* or *Ophiurina*, *Ophiurida* or *Ophiuræ* are the major terms of the series, naming the whole group of ophiurans; (*b*) *Ophiurida*, *Ophiuridae*, *Ophiurina*, *Ophiuræ*, *Ophiuræ* are middle terms designating the simple ophiurans as distinguished from the euryalans or *Astrophytidae*; and (*c*) *Ophiurida* is the minor term, designating a restricted family.

Ophrydæ (of-ri-dē), *n. pl.* [*N.L.* (Lindley, 1826), < *Ophrys* (stem taken to be *Ophryd* + *-æ*).] A tribe of orchids, distinguished by the anther-cells being adnate to the top of the column and often continuous with the beak of the stigma. It includes 33 genera, especially of southern Africa, of which *Ophrys* is the type, and *Orchis*, *Habenaria*, and *Disa* are the best-known, all terrestrial, with the roots a cluster of thickened fibers, producing an annual unbranched leafy stem, with a terminal spike or raceme of bracted flowers. See cut under *Habenaria*.

See *poppy* and *Papaver*. The opium exudes as a milky juice from shallow incisions made in the partly ripened capsules or heads still on the plant. It soon thickens, is collected by scraping, and kneaded into a homogeneous mass, forming then a reddish-brown sticky gum-like substance of bitter taste and peculiar odor. Opium was known to the Greeks, but was not much used before the seventeenth century; at present it is the most important of all medicines, and its applications the most multifarious, the chief of them being for the relief of pain and the production of sleep. Its habitual use is disastrous and difficult to break up. It is classed as a stimulant narcotic, acting almost exclusively on the central nervous system when taken internally; in large quantities it is a powerful narcotic poison, resulting in a coma characterized by great contraction of the pupils, insensibility, and death. The chief active principle of opium is morphia, but it also contains at least sixteen other alkaloids, some of which have similar properties. (See *narcotine*.) Though opium can be produced in Europe, the United States, etc., its commercial production is limited to countries where labor is cheap and the drug in common use, namely Turkey, Persia, Egypt, India, and China. The Western market is supplied largely from Asia Minor. The Indian export goes chiefly to China.

opossum (ô-pos'um), *n.* [Formerly also *oposom*; also, and still in rural use, abbr. *possum*, formerly *possovine*; Amer. Ind.] 1. An American marsupial mammal of the family *Didelphidae* (which see for technical characters). They have the four kinds of teeth which carnivorous quadrupeds regularly possess (incisors, canines, premolars, and molars), and are omnivorous, eating fish and carrion, reptiles, insects, and fruits. The head is conical, and the snout somewhat resembles that of a pig; the ears are large, leafy, and rounded; the eyes are small; the whiskers are long; the legs are of proportionate length; both fore and hind paws are five-toed, fashioned like human hands, especially the hind ones, which have an opposable thumb; and the tail is generally long, scaly, and prehensile, so that the animal can hang by it. The pelage is coarse; the body is stout, and in size ranges from that of a large cat to that of a small rat. Most female opossums have on the belly a pouch containing the teats, into which the young are received as soon as they are born. They are born extremely small and imperfect. The Virginia opossum has 13 teats, and no doubt may have as many young at a birth, but the number is usually less. Opossums are nocturnal animals; they move on the ground rather slowly and awkwardly, but are more at home in trees, and some of the species are aquatic. Though they are nocturnal, the flesh is white and palatable, especially in the autumn, when they commonly appear stupid, and in confinement continue sullen and intractable. When caught or threatened with danger they feign death, and will submit to the most brutal maltreatment without showing a sign of animation, whence the proverbial expression "to play possum." Most opossums belong to the genus *Didelphis*, ranging from middle latitudes in the United States through the greater part of South America. The commonest and best-known is *D. virginiana*. There are perhaps a dozen others, among them pouchless ones, as *D. dorsigera*. The yapoks or water-opossums of South America form another genus, *Chironectes*.

Amongst the Beasts in Virginia there are two kinds most strange. One of them is the Female *Possovine*, which

hath a bag under her belly, out of which she will let forth her young ones, and take them in again at her pleasure. The other is the flying Squirrel.

(c) The angle between the optic axes in a biaxial crystal.—**Optic axis.** (a) See *axis*. (b) The line in a doubly refracting crystal in the direction of which no double refraction occurs. Crystals belonging to the tetragonal and hexagonal systems have a single optic axis, coincident with their vertical crystallographical axis; hence they are said to be *uniaxial*. Crystals belonging to the orthorhombic, monoclinic, and triclinic systems have two optic axes, and hence are *biaxial*.—**Optic chiasm.** In *anat.*, the commissure, decussation, or chiasm of the right and left optic nerves. The lobes are paired, right and left, and hence called *corpora bignina*, in animals below mammals. In man and other mammals each lobe is also marked by a cross-furrow, so that the two lobes form four protuberances, whence they are called *corpora quadrigemina*, and consti-

tute what are called in human anatomy the *nates* and *testes* of the brain. The optic nerves arise in part from the optic lobes. These important lobes decrease in relative size as the vertebrate scale ascends; thus, in some fishes they are quite as large as the cerebral hemispheres, and lie uncovered upon the surface of the brain; they are quite large in reptiles and birds; small in mammals (in man smallest in proportion both to the cerebrum and to the cerebellum), and entirely covered in, so that they do not appear upon the surface of the brain. See cuts under *cerebral* and *corpus*.—**Optic nerves** (*nervi optici*), the nerves of sight; the nerves of the special sense of vision, arising from the anterior quadrigeminal and external geniculate bodies and the pulvinar, and terminating in the retina. These nerves are purely sensory, and by means of them the retinal stimulations affect the brain—a process by which vision is accomplished. The optic nerves of opposite sides decussate or form the optic chiasm, and the phraze is sometimes restricted to the part of these nervous trunks beyond the chiasm, the rest being called the *optic tract*. See cuts under *brain*, *corpus*, and *eye*.—**Optic neuritis**. See *neuritis*, and cuts under *corpus* and *eye*.—**Optic pad**, a pad-like elevation at the end of the arms of a starfish on which an eye is situated.—**Optic papilla**. See *Stylommatophora*.—**Optic thalamus**, a large ganglion of the thalamencephalon, situated upon the crus and separated from the lenticular nucleus by the internal capsule. It gives origin to some of the fibers of the crura. Also called *tractus opticus*, a pair of *crura* and *corpus*.—**Optic tract** (*tractus opticus*), the part of the whole course of the optic nerves which is between the chiasm and the respective origins of the nerves. In man the tracts are narrow flat bands of white nerve-tissue crossing the crura, to which they are closely attached.—**Optic tubercles**, the corpora quadrigemina.—See *bigemina*.—**Optic vesicles**, in the embryo, a pair of vesicles developed from the anterior cerebral vesicles of the embryonic brain.—**Syn. Optic**, *Optical*. The former is chiefly said of the anatomy of the eye and of the physiology of vision, the latter chiefly of the science of optics: as, *optic nerve*, *tract*, *lobe*; *optical angle*, *center*, *effect*.

Relating to or connected with the science of optics; based on or constructed in accordance with the laws of optics: as, *optical laws*; *optical instruments*.—2. Pertaining to vision; *optic*.—3. Treating of or studying optics: as, *optical writers*. *Boyle*, *Works*, i. 673.—**Optical anomaly**. See *anomaly*.—**Optical center**, in a lens, a point so situated that the direction of every ray passing through that point remains unaffected by its transmission through the lens—what is, the incident and emergent parts of the ray are parallel. Geometrically it is defined as the point in which the optical axis of the lens is cut by the line joining the two points where any pair of parallel planes touch the opposite surfaces of the lens. In a double-convex or double-concave lens the optical center lies within that lens; in a plano-convex or plano-concave lens it is the point where the curved surface of the lens is pierced by the axis; in the meniscus and concavo-convex it lies outside of the lens, beyond the surface which is most strongly curved. If the thickness of the lens is small compared with its focal length, the dimensions of object and image will be very nearly proportional to their distances from the optical center. Combinations of several lenses do not possess an optical center.—**Optical circle**, in *physics*, a graduated circle, fitted with the necessary appliances, used for illustrating the laws of refraction and reflection, or when accurately constructed, for measuring interfacial angles, refractive indices, etc.—**Optical densimeter**, *equation*, *glass*, *meteorology*, *square*, etc. See the nouns.—**Syn.** See *optic*.

Between the eye and the speculum is a piece of parallel-faced glass with a small dot at its center, exactly in the focus of the eye-glass. This dot is made to pass over the outlines of an object, and a pencil fixed at the eye-end traces the delineation on paper.

(a) Properly, the metaphysical doctrine of Leibnitz that the existing universe is the best of all possible universes. The most characteristic moments of the doctrine are two: first, that the Creator selected this universe from a number of others which he might have created; and second, that all of these presented certain imperfections or disadvantages which omnipotence could not avoid. (b) The doctrine that the universe advances on the whole, so as to be tending toward a state in the indefinite future different in its general character from that in the indefinite past. This is better called *evolutionism*. It is opposed to *pessimism*, which holds that the universe is tending to the nothingness from which it sprang, and to *Epicureanism*, which holds that the universe is not tending from any general state to any other general state. 2. The belief, or disposition to believe, that whatever exists is right and good, in some inscrutable way, in spite of all observations to the contrary.

The Christian *optimism* is the recognition that in a spiritual world a spiritual being, as such, cannot find an absolute limit or foreign necessity, against which his life must be broken in pieces; but that, on the contrary, all appearance outward limits, and even death itself, are for it but the means to a higher freedom and realization of self.

E. Caird, *Hegel*, p. 217.

It seemed to chill the flow of the good fellow's *optimism*, so that he assented with but lukewarm satisfaction.

Hovell, *Modern Instances*, ix.

2. One who believes in the present or ultimate supremacy of good over evil; one who always hopes for and expects the best; a person of hopeful disposition.

One such I knew long since, a white-haired man, . . . A genial optimist. *Bryant*, *Old Man's Counsel*.

II. *a.* Of or pertaining to optimism; optimistic: as, the *optimist* view. **optimistic** (op'ti-mis'tik), *a.* [*< optimist* + *-ic*]. Of, pertaining to, or characterized by optimism; disposed to take the most hopeful view of a matter; hopeful; sanguine.

In bot., one of the three cardinal points of temperature—namely that point at which the metabolic processes are carried on with the greatest activity.

The minimum or zero point is the point at which the performance is just possible; the *optimum point*, at which it is carried on with the greatest activity; and the maximum point, at which it is arrested." (*Vines*.)

Every vegetative (and fructificative) process has certain limits of temperature, and a fixed optimum in each species. *De Barry*, *Fungi* (trans.), p. 353.

option (op'shon), *n.* [*< F. option* = *Sp. option* = *Pg. opção*, < *L. optio* (n-), choice, free choice, option, < *optare*, choose: see *optate*]. 1. Choice; wish; preference; election.

See *seller*.—**Option** is the right of choice, the freedom to choose between two or more: as, "there is no *option*," *Shedd*, *Homiletics*, p. 30. *Choice* is primarily the act of choosing, but, by extension, may be the same as *option*: as, he gave him the *choice*. *Preference* is primarily the state of mind determining the choice, and sec-

ondarily the act of choosing. *Election* emphasizes the leaving of some while the choosing others. *Choice* and *preference* may apply to that which is chosen; the others not. **optional** (op'shon-əl), *a.* and *n.* [*Option* + *-al*.] **I. a.** 1. Cf. *optometer*.] **1.** The measurement of the range of vision.—**2.** The measurement of the visual powers in general (including the acuteness of the perception of form, of light, and of colors—eidometry, photometry, and chromatometry respectively), of the extent of the visual field (perimetry), of the accommodative and refractive states of the eye (diop-

tometry), and of the position and movements of the eyeball (ophthalmometry and ophthalmotometry).

Tennyson, *Maud*, xiii.

=*Syn.* *Opulence*, *Wealth*, *Riches*, *Affluence*. All these words imply not only the possession of much property, but the possession of it under such circumstances that it can be and is enjoyed. They seem contrasted not only with their opposites, but with the possession of a moderate amount. *Opulence* is a dignified and strong word for wealth. *Wealth* and *riches* may mean the property possessed, and *riches* generally does mean it; the others do not. *Affluence* suggests the flow of wealth to one, and retaining free expenditure for objects of desire. There is little difference in the strength of the words.

Opuntia (ō-pun'shi-ā), *n.* [*NL.* (Tournefort, 1700), < *L. Opus* (*Opunt*), < *Gr. ὄπος* (*Opous*), a town of Locris in Greece, where some cactus-like plant, "herba Opuntia," is mentioned by

Pliny as growing.] A genus of cacti, type of the tribe *Opuntieae* in the order *Cactaceae*, having the stamens shorter than the half-erect petals. There are about 200 species, of warmer America, with one species widely scattered throughout the Old World. They are fleshy herbaceous shrubby plants, or sometimes trees, their branches usually composed of flattened or globose joints, with hairy tubercles which are set with sharp spines. They bear small scale-like leaves on the younger branches, lateral yellow, red, or purple flowers, and pear-shaped berries. For uses and names, see *cocchineal* and *prickly-pear*; also *Indian fig* (under *fig*), *hedgehog-thistle*, and *tuna*.

Opuntia (ō-pun'ti-ā), *n. pl.* [*NL.* (Bentham and Hooker, 1865), < *Opuntia* + *-ea*.] A tribe of polypetalous plants of the order *Cactaceae*, distinguished by the short calyx-tube, not prolonged beyond the ovary. It contains 4 genera, of which *Opuntia* is the type and only important one, and about 250 species, principally American. They are succulent perennials, shrubs or sometimes trees, armed with sharp spines. Their usually lateral and large flowers are followed by pear-shaped or roundish berries. See cut under *Opuntia*.

opus (ō'pus), *n.*; *pl. opera* (op'ē-rā). [*L.*, work, a work: see *opera*.] Work; a work, as a literary or musical composition (in the latter use often abbreviated *op.*). A single *opus* may contain two or more numbers: as, *Op. 48*, No. 3.—**Opus Alexandrinum**, Alexandrian work: a type of mosaic pavement consisting of geometric figures in black and red tesserae on a white ground.—**Opus araneum**, a kind of needlework done in white thread, with figures of men, angels, and animals, liturgical vessels, etc. The name is given especially to such work of the fourteenth and fifteenth centuries.—**Opus filatorium**, the ancient name for fancy work of all sorts done with threads, including drawn and darned embroidery, and all kinds of netting and the like; especially, an embroidery in thread or colored silk on a fabric of small square meshes, sometimes having a pattern cut out of thin stuff applied and edged with needlework.—**Opus incertum** or *opus antiquum*, masonry formed of small rough stones set irregularly in mortar, and in some examples traversed by beds of bricks or tiles.—**Opus insertum**, in masonry, regular stonework in which the vertical joints of every

course fall in the middle of the blocks of the courses immediately above and below.—**Opus interrasile**, decoration produced by cutting away the ground, leaving the pattern, or cutting out the pattern, so that the openings form the design.—**Opus lateritium**, in ancient masonry, brickwork or tilework.—**Opus magnus** or *magnus opus*, a great work; a literary or artistic work on which one spends his best powers.—**Opus musivum**, mosaic.—**Opus operantis**, literally, the work of the worker; in *theol.*, the effect of a sacrament considered as proceeding from the spiritual disposition or condition of the recipient. The doctrine that the sacraments confer benefits *ex opere operantis* from the act of the person acting or taking part in them, is regarded as a distinctively Protestant view, in opposition to the doctrine that the benefit is derived *ex opere operato*.—**Opus operatum**, literally, a work wrought; in *scholastic* and *Roman Catholic theology*, the due celebration of a sacrament, considered as necessarily and inherently involving the grace of the sacrament. Sacramental grace is said by Roman Catholic theologians to be conferred *ex opere operato*, 'from the (sacramental) act performed,' the sacrament deriving its power from the institution of Christ, and not from the merit of the minister or recipient. Sacraments

are therefore viewed as conveying grace to the recipient, unless by want of the due dispositions, such as faith, love, repentance, etc., he willfully interposes a barrier which prevents his receiving the grace. Certain schoolmen are thought to have taught that the sacraments produce their full effect in all cases without restriction, and this doctrine has often been imputed by Protestant controversialists to the Roman Catholic Church, inasmuch as that contained in the decrees of the Council of Trent (session vii., canon viii.), as explained by Bellarmine and others, and given above. Anglican theologians have sometimes used this phrase to express the doctrine of the Church of England that the inward grace is one of the two integral parts of a sacrament (Catechism), that the sacraments are signs which are effectual (Articles xvi., and that, as the English bishops declared at the Savoy conference, "sacraments have their effects where the receiver doth not 'ponere obicem,' put any bar against them." *Procter*, Book of Common Prayer (Amer. ed.), p. 124.—**Opus phrygium**, in the middle ages, embroidery. Compare *Phrygian work* (under *Phrygian*) and *auriphrygia*.—**Opus plumarium**, an old name for *feather-stitch*.—**Opus punctatum**. Same as *pounced work*.—**Opus reticulatum**, in masonry, regular stonework or brickwork in square blocks, the courses of which are inclined at an angle of 45° to the horizon, so that the joints resemble a network.—**Opus Saracenicum**, Saracenic work (that is, tapestry, rugs, etc.), imported from the East.—**Opus sectile**, a kind of pavement formed of slabs or tiles of glass or other material, the pieces having a definite size, far larger than the tesserae of ordinary mosaic. They are sometimes of plain color and sometimes mottled and veined.—**Opus signinum**, a kind of tough cement or stucco used by the ancient Romans to coat the interior of aqueducts, etc.—**Opus spicatum**, herring-bone masonry.—**Opus tessellatum**, a pavement formed of slabs or tiles of glass or other material, called *tesserae* or *tessellae*, of larger size and more regular form than the pieces used in mosaic.

colo, < L. *oraculum*, synecopated *oraculum*, a divine announcement, a prophecy, a place where such were given, < *orare*, pray: see *oration*.] 1. In *class. antiq.*: (a) An utterance given by a priest or priestess of a god, in the name of the god and, as was believed, by his inspiration, in answer to a human inquiry, usually respecting some future event, as the success of an enterprise or battle, or some proposed line of conduct. Such oracles exerted for centuries a strong influence upon the course of human affairs, the belief of both the medium and the questioner in their divine inspiration being in most cases genuine. The oracles themselves, however, were often ambiguous or at least obscure. The prestige of the chief oracular seats of Greece was powerful in the promotion of good government and justice. After the introduction of Christianity the utterance of oracles gradually ceased. It was a common belief of early Christians that the oracles actually proceeded from evil spirits.

Though I am satisfied and need no more
Than what I know, yet shall the oracle
Give rest to the minds of others.

Shak., W. T. II. i. 100.

(b) The deity who was supposed to give such answers to inquiries.

No voice or hideous hum
Runs thro' the arch'd roof in words deceiving.

Oracles are brief and final in their utterances.

O. W. Holmes, Emerson, iv.

(c) The place where oracular answers were given; the sanctuary, temple, or adytum whence the supposed supernatural responses proceeded. The Greeks surpassed every other nation in both the number and the celebrity of their oracles. Those of Zeus at Dodona in Epirus, of Apollo at Delphi, and of Trophonius near Lebadeia in Boeotia enjoyed the highest reputation.

Thither come,
And let my grave-stone be your oracle.

Shak., T. of A., v. 1. 222.

2. Hence, by extension.—(a) The communications, revelations, or instruction delivered by God to or through his prophets: rarely used in the singular: as, the oracles of God; the divine oracles.

Acts vii. 38.

They presume that the law doth speak with all indifference; that the law hath no side-respect to their persons; that the law is, as it were, an oracle proceeded from wisdom and understanding.

Hooker, Eccles. Polity, i. 10.

(b) The sanctuary or most holy place in the temple, in which was deposited the ark of the covenant (1 Ki. vi. 19): sometimes used for the temple itself.

The priests brought in the ark of the covenant of the Lord unto his place, into the oracle of the house, to the most holy place, even under the wings of the cherubims.

1 Ki. viii. 6.

The fruit of the orange-tree, a large globose berry of eight or ten membranous cells, each containing several seeds which are packed in a pulp of fusi-form vesicles, distended with an acidulous refreshing juice. There are three principal varieties of the orange—the sweet or China orange, *Citrus Aurantium* proper, including the ordinary market sorts; the bitter or Seville orange or bigarade, variety *Bigaradia*, used for making marmalade, its pulp being specially valued; and the bergamot orange, variety *Bergamoti*, classed by some, however, as a variety of *Citrus Medica* (see *bergamot*, 1). 2. Its flowers are prized when fresh (see *orange-blossom*), and chiefly those of the bitter orange yield neroli-oil and orange-water. The varieties of the orange are very numerous, distinguished most obviously by their fruit. Its origin is referred to India, whence it spread to western Asia, thence reaching Spain and Italy, through the agency of the Moors and the crusaders, between the eleventh and fourteenth centuries. It is now cultivated in nearly all tropical and subtropical lands, including China and Japan, the whole Mediterranean basin, the West Indies, and the southern borders of the United States, having, indeed, become thoroughly wild in Florida.*

Orang-utan (*Simia satyrus*).

very different from those of man, in whom the height and the reach of the arms are nearly the same. The arms of the orang-utan reach nearly to the ground when the animal stands erect. This attitude is difficult and constrained, and is not ordinarily assumed. The animal is most at home in trees, where it displays extraordinary agility. In walking on level ground it stoops forward, brings the hands to the ground, and swings the body by the long arms, much

as a lame person uses crutches. Both hands and feet are long and narrow, with bent knuckles and short thumbs and toes, so that the palms and soles cannot be pressed flat upon plane surfaces. The face, hands, and feet are naked, and the fur is scanty or thin, though rather long; it is of a brownish-red or Auburn color. Orang-utans live in trees, where they build large nests and feed on fruits and succulent buds or shoots. The strength of the animal is great in proportion to its size, and when brought to bay it proves a formidable antagonist. Also *oranga*.

oratorio (ôr-â-tôr-i-ô), n. [*It. oratorio*, < LL. *oratorium*, a place of prayer, an *oratory* or a chapel. The name was originally given to sacred musical works because they were first performed in the *oratory* of the church of Sta. Maria in Vallicella, under the patronage of Philip Neri: see *oratory*.] 1. A place of worship; a chapel; an *oratory*.—2. A form of extended musical composition, more or less dramatic in character, based upon a religious (or occasionally a heroic) theme, and intended to be performed without dramatic action and scenery.

The modern *oratorio* and opera both date from the musical revolution in Italy, about 1600, and were originally indistinguishable from each other, except that one was sacred and the other secular in subject. Both employed the same musical means, such as recitatives, arias, duets, choruses, instrumental accompaniments and passages, and at first even dancing also (for which see *opera*), and both were dramatically presented. But before 1700, particularly in Germany, the *oratorio* began to be clearly differentiated from the *opera*, in the relinquishment of dramatic action and accessories, though not usually of dramatic personification, in the more serious, reflective treatment of both arias and choruses, and in the use throughout of contrapuntal resources. The *oratorio*, therefore, came to belong essentially to the class concert music, with more or less of the qualities of church music. The true *oratorio* style has never been popular in either Italy or France, but has had a remarkable development in both Germany and England.

The strong predilection for it has existed since 1600 for passion plays in Germany directly to the cultivation of what is called the *passion-oratorio* or *passion-music*, the theme being the passion and death of Christ, and the whole work being conceived from a decidedly liturgical standpoint. The most famous example of this style is the "Passion according to St. Matthew" of J. S. Bach. In England the works of the early part of the eighteenth century initiated an interest in the concert *oratorio* which has been constant and wide-spread. The method of treatment of the English *oratorio* has varied considerably, from the epic and contemplative to the representative and dramatic, with more or less of the lyrical intermingled. While the *oratorio* style in general has seldom attained to the passionate intensity and complexity of the eighteenth century, it has in the expression of the lofty spiritual emotions connected with religious thought. Its independence of theatrical limitations has made possible a far more free and elaborate handling of the chorus as a separate artistic means, so that most *oratorios* are essentially choral works. The *oratorio* has never occupied the same position of social importance as the *opera*, but it has perhaps contributed more to the world's store of new artistic conceptions.

Track; course; path, especially a path, as that in a circle or an ellipse, which returns into itself; specifically, in *astron.*, the path of a planet or comet; the curve-line which a planet describes in its periodical revolution round its central body or center of revolution: as, the orbit of Jupiter or Mercury. The orbits of the planets are elliptical, having the sun in one of its foci: and they all move in these ellipses by this law—that a straight line drawn from the center of the sun to the center of any one of them, termed the *radius vector*, always describes equal areas in equal times. Also, the squares of the times of the planetary revolutions are as the cubes of their mean distances from the sun. These are called *Keppler's laws* (see *law*). The attractions of the planets for one another slightly derange these laws, and cause the orbits to undergo various changes. The satellites, too, move in elliptical orbits, having their respective primaries in one of the foci. The parabolic and hyperbolic paths of comets are also called orbits. The elements of an orbit are those quantities by which its position and magnitude for the time are determined, such as the major axis and eccentricity, the longitude of the node and the inclination of the plane to the ecliptic, and the longitude of the perihelion. In the ancient astronomy the orbit of a planet is its eccentric or the deferent of its epicycle.

Tennyson, *In Memoriam*, lxxxvii.

3. In *anat.* and *zool.*, the bony cavity of the skull which contains the eye; the eye-socket.

In man the orbits are a pair of quadrilateral pyramidal cavities completely surrounded by bone, and separated from the nasal cavity by the ethmoidal bone, communicating with the cranial cavity and the nasal and temporal fossæ, and opening forward upon the face, with the apex at the optic foramen where the optic nerve enters. Seven bones enter into the formation of each orbit, the frontal, sphenoid, ethmoid, maxillary, palatal, lacrimal, and malar, of which the first three are common to both orbits. Each orbit communicates with surrounding cavities by several openings, the principal of which are—with the cranial cavity by the optic foramen and sphenoidal fissure; with the nasal fossæ by the lacrimal canal; with the temporal and zygomatic fossæ by the sphenomaxillary fissure; with the ethmoidal fossæ by the anterior and posterior ethmoidal foramina; and with the face by supra-orbital, infra-orbital, extra-orbital, and malar foramina. The orbit contains the eye and its associated muscles, vascular, glandular, sustentacular, mucous, and nervous structures.

In *Diptera* the different parts of this border are distinguished as the anterior or facial orbit, the inferior or genal, the posterior or occipital, the superior or vertical, and the frontal, according to the regions of the head of which they form a part. When not otherwise stated, orbit generally means the inner margin of the eye, or that formed by the epicranium.—Equation of the orbit. See *equation*.

Also called *orbital nerve*.—Orbital plate, the os planum or smooth plate of the ethmoid bone, which in man, but not usually in other animals, forms a part of the inner wall of the orbit. (b) The thin horizontal plate of the frontal bone on both sides forming the roof of the orbit.—Orbital process, a process of the palatine bone which in man enters to a slight extent into the formation of the orbit.—Orbital sulcus. 2. In *mod. music*, a company of performers on such instruments as are used in concerted music; a band. (In the United States *band* usually signifies a military band; but in England *band* is interchangeable with *orchestra*.) The historic development of the orchestra as now known did not begin until about 1600, when the independent value of instrumental music was first generally accepted. Up to that time, though many instruments had been known and used, both alone and as supports for vocal music, they had not been systematically combined, nor had concerted music been written for them. The process of experiment, selection, and improvement in construction and mutual adaptation went on steadily until nearly 1800, when the orchestra first arrived at its present proportions. The instruments now used consist of four main groups: (a) the *strings*, including violins (first and second), violas, violoncellos, and bass violas, these together constituting the largest and decided-ly the most important group, which is often used entirely alone, and is then called the *string-orchestra*; (b) the *wood wind*, including flutes, oboes, clarinets, English horns, bassets-horns, bassoons, etc., these all being used both to enrich the effect of the strings, and in alternation with them to afford contrasts in tone-quality; (c) the *brass wind*, including French horns, trumpets, cornets, trombones, euphoniums, etc., these being also used both in conjunction and in contrast with the other groups, though their decidedly greater sonority makes their introduction necessarily more rare; and (d) the *percussives*, including tympani, snare and bass drums, cymbals, bells and triangles, harps, etc., and also sometimes the pianoforte, though the latter is seldom ranked as a true orchestral instrument. The proportions of the several groups are varied somewhat both by composers and by conductors. A full orchestra is one in which all these groups are present in fairly complete form; a small orchestra is one in which some important instruments are lacking. All the above instruments, except the harp, are essentially monophonic, and the peculiar artistic importance of the orchestra is based upon the fact that every element in the total effect is produced by a solo instrument in the hands of a separate performer. The orchestra is extensively employed both in accompanying vocal music of every kind and in purely instrumental works. Its unlimited capacities for varied effect have led to the production of an extensive musical literature, in which are some of the most famous specimens of musical art. The orchestra is an indispensable factor in all extended works like operas and oratorios. The maintenance of orchestras was originally undertaken by individual princes in the several European states; but they are now either attached to opera-houses or supported by the proceeds of popular concerts.

cented form of *ar*-, usually *â*- (see *a-1*), + *dêl*,
dâl, a part, deal (or rather the base of the orig.
verb), with a suffix lost in AS., but retained in
OS. and OHG.: see *or*- and *deal*. The techni-
cal use of the word, the disappearance of *or* as
a significant prefix, and the remoteness of
the main element -*deal* from its etym. mean-
ing, led to a separation of the word from its
actual source, and its treatment as of L. origi-
n; hence the ordinary pron. in three syllab-
les (as if the termination were like that of *real*,
ideal, etc.), instead of the orig. two (ôr-dêl).]
1. n. 1. A form of trial to determine guilt or
innocence, formerly practised in Europe, and
still in parts of the East and by various savage
tribes. It consisted in testing the effect of fire, water,
poison, etc., upon the accused. Well-known fire-ordeals
in England were the handling of red-hot irons, or the walk-
ing over heated plowshares. A common form of the wa-
ter-ordeal was the casting of the accused into water: he
was considered innocent if he sank, guilty if he floated.
The practice of "ducking witches" is a survival of this
water-ordeal, and the phrase "to go through fire and
water" probably alludes to those customs. These ordeals
were abolished in England in the reign of Henry III., but
the wager of battle remained. The ordeal of poison-water
is common in Africa; that of burning candles, in Burma;
that of eating rice, in Siam, etc.

By *ordal* or by oath,
By sort, or in what way so you lest.

3. Specifically—(a) The degree, rank, or sta-
tus of clergymen.

(b) One of the several degrees or grades of the
clerical office. In the Roman Catholic Church these
orders are bishop, priest (presbyter), deacon, subdeacon,
acolyte, exorcist, reader, and doorkeeper. Originally the
first three were accounted *major orders* and the others
minor orders. Since the twelfth century the order of sub-
deacon has been advanced to the rank of a major order, and
the number of orders is generally counted as seven, the or-
ders of bishop and presbyter being regarded as one order
in so far as the sacerdotal character belongs to both. In
the Orthodox Greek and other Oriental churches the major
orders are those of bishop, priest, and deacon, and the
minor orders are subdeacon, reader (anagnost), and some-
times singer (psalter). The orders of bishop, priest, and
deacon are known not only as *major* or *holy orders*, but
as *apostolic orders*. The orders of subdeacon, acolyte, exorcist,
and doorkeeper (ostiary) existed in the Western Church
before the middle of the third century; those of subdeacon,
exorcist, reader, singer, and doorkeeper were as old as the
third or fourth century in the Eastern Church. The Angli-
can Church retains only the orders of bishop, priest, and
deacon. Major orders can be conferred by bishops only.
Chorepiscopi, abbots, and priests have sometimes, how-
ever, been authorized to confer minor orders.

They cannot abide

Times' Whistle (E. E. T. S.), p. 14.

(c) In the Roman Catholic, Greek, Anglican,
and other episcopal churches, the sacrament
or rite of ordination, by which ecclesiastics re-
ceive the power and grace for the discharge
of their several functions: specifically termed *holy
order*, or more commonly *holy orders*. The bishop
alone can administer this rite. Orders as a sacrament
and sacramental rite are limited to the major orders.

He [a certain friar] went to Amiens to be fully confirmed

5. (a) In *zool.*, that taxonomic group which
regularly comes next below the class and next
above the family, consisting of one or more
families, and forming a division (sometimes the
whole) of a class. Like other classificatory groups, it
has only an arbitrary or conventional taxonomic value.
Compare *superorder*, *suborder*. (b) In *bot.*, the most
important unit of classification above the ge-
nus, corresponding somewhat closely to *family*
in *zoology*. See *family*, 6. In phanerogams the
term *family* is not technical or systematic, being some-
times applied to suborders, tribes, or even genera. In
cryptogams it is made a subdivision of the order by some
authors. See *natural order*, under *natural*.
6. A number of persons of the same profes-
sion, occupation, or pursuits, constituting a
separate class in the community, or united by

Shak., R. and J., v. 2. 6.

As a broad general rule, nearly every post-Reformation institute is styled not an *Order* but a "Congregation"; but the only distinction which can be drawn between these two names is that *order* is the wider, and may include several congregations within itself (as the Benedictine *order*, for example, includes the congregations of Cluny and of St. Maur), while a "congregation" is a simple unit, complete in itself, and neither dependent on another institute nor possessed of dependent varieties of its own.

Encyc. Brit., XVI. 715.

(b) An institution, partly imitated from the medieval and crusading orders of military monks, but generally founded by a sovereign, a national legislature, or a prince of high rank, for the purpose of rewarding meritorious service by the conferring of a dignity. Most honorary orders consist of several classes, known as *knight companions*, *officers*, *commanders*, *grand officers*, and *grand commanders*, otherwise called *grand cross* or *grand cordon*. Many orders have fewer classes, a few having only one. It is customary to divide honorary orders into three ranks: (1) Those which admit only nobles of the highest rank, and among foreign sovereign princes or members of reigning families; of this character are the Golden Fleece (Austria and Spain), the Elephant (Denmark), and the Garter (Great Britain); it is usual to regard these three as the existing orders of highest dignity. (2) Those orders which are conferred upon members of noble families only, and sometimes because of the mere fact of noble birth, without special services. (3) The orders of merit, which are supposed to be conferred for services only. Of these the Legion of Honor is the best-known type. Two of the orders of merit may be regarded as somewhat exceptional—the first class of the Order of St. George of Russia and the Order of Maria Theresa of Austria. The former is conferred only upon a commanding general who has defeated an army of 50,000 men, or captured the enemy's capital, or brought about an honorable peace. There is now no person living who has gained this distinction regularly, though it has been given to a foreign sovereign. Other orders of merit approach these more or less nearly, as they are conferred with more or less care. The various orders have their appropriate insignia, consisting usually of a collar of ribbon, or the like. It is common to speak of an order by its name alone, as the Garter, the Bath. An order is said to be *conferred* or *bestowed* upon the recipient of its distinction; the recipient is said to be *decorated* with such an order; and the word *order* is often applied to the decoration or badge. See *bath, garter, knighthood, star, thistle*, etc.

10. In *rhet.*, the placing of words and members in a sentence in such a manner as to contribute to force and beauty of expression, or to the clear illustration of the subject.—11. In *classical arch.*, a column entire (including base, shaft, and capital), with a superincumbent entablature, viewed as forming an architectural whole or the characteristic element of a style. There are five orders—Doric, Ionic, Corinthian, Tuscan, and Composite. (See these adjectives.) Every order consists of two essential parts, a column and an entablature; the column is normally divided into three parts—base, shaft, and

capital; the entablature into three parts also—architrave, frieze, and cornice. The character of an order is displayed not only in its column, but in its general form and details, of which the column is, as it were, the regulator. The Tuscan and Composite are Roman orders, the other three are properly Greek, the Roman renderings of them being so different from the originals as to constitute in fact distinct orders. The Corinthian, though of purely Greek origin, did not come into extensive use before Roman authority was established throughout Greek lands.

The temple on the side of the river seems to be of the greatest antiquity, and was probably built before the orders were invented.

12. In *math.*: (a) In geometry, the degree of a geometrical form considered as a locus of points, or as determined by the degree of a locus of points. Newton introduced the term *order* as applied to plane curves. Cayley defines the *order* of a relation in *m*-dimensional space as follows: add to the conditions as many arbitrary linear conditions as are necessary to make the multiplicity of the relation equal to *m*; then the number of points satisfying these conditions is the *order* of the relation. Thus, the *order* of a *plane curve* is the number of points (real and imaginary) in which this curve is cut by an arbitrary right line. The *order* of a *non-plane curve* is the number of points in which the curve is cut by a plane. The *order* of a *surface* is the number of points in which the surface is cut by a right line. The *order* of a *congruence* is the number of points in which the congruence-lines lying in an arbitrary plane are cut by an arbitrary plane. The *order* of a *complex* is the number of points in which the curve enveloping the lines of the complex lying in an arbitrary plane is cut by an arbitrary plane. (b) In analysis, the number of elementary operations contained in a complex operation; also, that character of a quantity which corresponds to the degree of its algebraic expression. The *ordinaries* are the oldest bearings, and in general the oldest escutcheons are those which are charged only with the *ordinaries*, or with these primarily, other changes having been added. The bearings most generally admitted as *ordinaries* are the eight following: bar, bend, chevron, chief, cross, fesse, pale, and saltire; but most writers add one, some two, and others a greater number, namely one or more of the following: bend sinister, inescutcheon, quarter or franc-quarter, pile, bordure. By some writers also the subordinates and *ordinaries* are considered together under one head. The *ordinaries* are often called *honorable ordinaries*, to distinguish them from the subordinates.

Bends, chevrons, and bars are three of the somewhat numerous *ordinaries*, so called from their frequent use.

2. The act of admitting to holy orders, or to the Christian ministry; the rite of conferring holy orders or investing with ministerial or sacerdotal power and authority. In episcopal churches, including the Roman Catholic Church, the Greek and other Oriental churches, and the Anglican Church, ordination consists in imposition of hands by a bishop upon the candidate, thus admitting him to one of the holy orders, and conferring on him the powers of that order and authority to perform its functions. The act of elevation to the episcopate is in strict technical use called *consecration*, not *ordination*. *Ordination* in its wider sense includes admission to the minor orders, which are usually conferred in the Roman Catholic Church by a bishop, but can be bestowed by an abbot, the act of admission consisting in the tradition (delivery) of the instruments. In Presbyterian churches the power of ordination rests with the presbytery, who appoint one or more of their number to conduct the ordination ceremonies, which include laying on of hands. In Congregational and Baptist churches ordination is customarily performed by the pastors of other churches (of the same denomination), but is regarded as necessary only for the preservation of church order; and the service is regarded as conferring no special religious authority. See *institution, induction, installation*.

As for *Ordination*, what is it but the laying on of hands, an outward signe or symbol of admission?

ordnance (ôr'dnâns), *n.* [An old form of *ordnance*: see *ordnance*, 5. Cf. *ordnance*.] Cannon or great guns collectively, including mortars and howitzers; artillery. As a technical term, it designates all heavy pieces fired from carriages. Modern ordnance may be divided into two classes, *smooth-bore* and *rifled*. The former are all muzzle-loaders; the latter are subdivided into *muzzle-loaders* and *breech-loaders*. Most guns of modern construction are breech-loading rifled arms. Classified according to the material used, cannon are *bronze*, *cast-iron*, *wrought-iron*, *steel*, or *mixed cast* (*wrought-iron and steel*) guns; according to the method of construction, they are called *solid* or *built-up* guns. The most modern type of heavy gun is an all-steel built-up breech-loading gun, with a Krupp or interrupted-screw ferreture. Formerly sometimes used in the plural.

(b) A board composed of United States ordnance-officers distinguished for their attainments in the theory and practice of heavy ordnance, its construction and use, whose duty it is to conduct experiments, and test and report upon all ordnance subjects referred to it by the chief of ordnance. This board is designated by the Secretary of War, and advises to the chief of ordnance of the army.

Ordinance stores, a general phrase including everything pertaining to the manufacture, equipment, and service of ordnance or artillery. It comprises all projectiles and explosives, pyrotechnic stores, gun-carriages, caissons, limbers, mortar-beds, cavalry and artillery forges, battery-wagons, and all machines for mechanical maneuvers and for transportation, tools and materials for fabrication, repair, or preservation, all small-arms, accoutrements, and equipments and ordnance stores. The phrase "ordnance and ordnance stores" covers everything in the form of a weapon that is used in war, together with all the materials and appliances necessary for their construction, repair, preservation, and use.—**Ordinance survey,** the survey of Great Britain, undertaken by the government, and executed by select corps of the Royal Engineers and civilians. The charts exhibit, in addition to the ordinary features of a map, the extent and limits of properties; and rivers, roads, houses, etc., are laid down on them in their just proportions, and not, as in ordinary maps, exaggerated. The scale adopted by the British government is, for towns having 4,000 or more inhabitants, $\frac{1}{2}$ in of the linear measurement, which is equivalent to 136.72 inches to a mile, or 1 inch to 413 feet; for parishes, or for uncultivated districts, $\frac{1}{4}$ in of the linear measurement, equal to 25.344 inches to a mile, or very nearly 1 square inch to an acre; for counties, $\frac{1}{6}$ inches to a mile; for the kingdom, a general map, 1 inch to a mile. The purposes to which these large plans may be applied are as estate plans, for managing, draining, and otherwise improving land, for facilitating its transfer by registering sales and incumbrances, and as public maps, according to which local or general taxes may be levied, and roads, railways, canals, and other public works laid out and executed.—**Rifled ordnance.** See *rifled cannon*, under *cannon*.

Ordovician (ôr-dô-vish'ian), *a.* [Named from the *Ordovices*, an ancient British (North Welsh) tribe.] An epithet applied by C. Lapworth to a series of rocks not capable of exact separation from those underlying or overlying them, either stratigraphically or paleontologically, but which have been the subject of much discussion among English geologists. They form a part of the Lower Silurian of Murchison, more or less of the Upper Cambrian of Sedgwick, the Cambro-Silurian of Jukes, the Siluro-Cambrian of some authors, the second fauna of Barrande, etc. As limited in Wales, according to H. B. Woodward, the Ordovician may be said to extend from the base of the Arenig series to the base of the Llandovery. Graptolites and trilobites are the most abundant fossils, and there is a large amount of intercalated volcanic material. The name Ordovician does not appear in the text-book of geology recently issued by the director of the Geological Survey of Great Britain, nor has it any place in American Silurian geology as worked out by the New York and Pennsylvania Surveys, nor can the strata thus named in England be strictly paralleled with any one or more divisions of the Silurian as established in the United States.

A metalliferous mineral or rock, especially one which is of sufficient value to be mined.** A mixture of a native metal with rock or veinstone is not usually called ore, however, it being understood that in an ore proper the metal is in a mineralized condition—that is, exists in combination with some mineralizer, as sulphur or oxygen. The ore and veinstone together constitute the mass of the metalliferous deposit, vein or lode. The ore as mined is usually more or less mixed with veinstone, and from this it is separated, as completely as may be convenient or possible, by means of one or more complicated series of operations, frees it from the lower metallic material which still remains mechanically mixed with it, and also sets it free from its chemical combination with the substances by which it is mineralized.

In the male the body is slender; the proboscis is short; the palpi are short and very hairy, with the third joint shortest; the antennae are broadly pectinate; the hind tibiae have two short apical spurs, or four long ones; and the wings are broad, extending beyond the end of the abdomen. tain-copper; < *ὄρος*, mountain, + *χαλκός*, copper; see *chalchitis*.] The equivalent in English of the Greek *ορείχαλκος*, the name of a metallic alloy or metal of brilliant luster, mentioned by Greek authors of a very early date, and considered by them as worthy to be classed with gold and silver in respect of value. Plato, while often speaking of it, admits that orichalc was no longer to be had in his time; and some (Aristotle, it is said, among them) deny that any such metal ever existed. The word passed into Latin under the form of *orichalcum*, and later that of *aurichalcum*. Although sometimes used as the name of brass (as by Strabo, who, with as near an approach to accuracy as was possible in those days, describes the method of manufacturing that metal and calls the alloy *orichalcum*), it had in general—even down to the middle ages—a more or less uncertain meaning, standing sometimes for an entirely ideal and very precious substance and sometimes for an ordinary metal or alloy (as copper or bronze), but having a peculiar value on account of the manner in which it was made, or the locality whence it came.

The metall was of rare and passing price;
Not Bilbo steele, nor brasse from Corinth fet,
Nor costly *Oribates* from orange Phoenix,
But such as could both Phebus arrows ward,

Who can tell how far the *orientalists* were wont to adorn their parables?

Le Clerc, Comment on Job xlii. 14. (Latham.)

2. [*cap.*] One who is versed in the languages and literature of the East; opposed to *Occidentalists*.

There is not so much difference between the literary and popular dialects of Arabic as some European *Orientalists* have supposed. *E. W. Lane, Modern Egyptians, 1. 263.*

orientality (ô-ri-en-tal'i-ti), *n.* [*F. orientality* + *-ity*.] The quality of being oriental, or of rising in the east.

Whose [the sun's] revolution being regular, it hath no power nor efficacy peculiar from its *orientality*, but equally disperseth his beams unto all which equally, and in the same restriction, receive his lustre.

See *orient, v., 2.—2.* To determine or ascertain the position of, especially with reference to the east; determine or fix the position or bearings of; figuratively, to take one's proper bearings mentally.—3. To place, as a crystal, in such a position as to show clearly the true relation of the several parts.

II. *intrans.* 1. To assume an easterly direction; turn or veer toward the east; specifically (*eccles.*), to be so constructed that the end nearest the altar or high altar (ecclesiastically accounted the eastern end) is directed toward a certain point of the compass; especially, to be so placed that the conventional eastern end is directed toward the geographical east.

The only two instances . . . in which it [orientation] is departed from [in the Eastern Church] are those of Hagios Georgios . . . in Crete, which *orientates* north, and of the Asonatol . . . in the Morea, which *orientates* south. *J. M. Neale, Eastern Church, 1. 222.*

2. To worship toward the east; especially, to celebrate the eucharist in the eastward position—that is, facing the altar. See *eastward, a.*

orientation (ô-ri-en-ta'shon), *n.* [*F. orientation*, < *ML. *orientation(n)-*, < **orientare*, orient: see *orientate*, *orient, v.*] 1. The act of turning or the state of being turned toward the east. Specifically—(a) The position of worshippers facing toward the east, or, in Christian worship, toward that end of a church which is known as the eastern end; especially (*eccles.*), that position of a priest celebrating the eucharist in which he faces the altar; the eastward position.

Where among the lower races sun-worship begins to consolidate itself in systematic ritual, the *orientation* of the worshipper and the temple becomes usual and distinct. *E. B. Tyler, Prim. Culture, II. 384.*

(b) Such a position of a corpse in a grave that the head is toward the west and the feet toward the east.

The same symbolism of east and west has taken shape in actual ceremony, giving rise to a series of practices concerning the posture of the dead in their graves and the living in their temples, practices which may be classed under the general heading of *Orientation*.

E. B. Tyler, Prim. Culture, II. 382.

(c) The construction or position of a church so that it has that end which contains the chancel or sanctuary in the direction of the east.

The very ancient practice of *orientation* in the building of churches can hardly be set aside as "a High Church piece of pedantry." Allusion to worship toward the east may be found in the early Hieroglyphs and Church fathers; and in this country, at least, *orientation* has been practiced from the first introduction of Christianity into these islands down to the present time, with the interruption of the Great Rebellion. *N. and Q., 7th ser., VII. 469.*

(d) Hence, the position of a building or of any object with reference to any point of the compass.

The later builders of Thebes appear to have had no notion of *orientation*, but to have placed their buildings and tombs so as to avoid regularity, and facing in every conceivable direction. *J. Ferguson, Hist. Arch., 1. 96.*

(e) In *crystal*, the position of a crystal—of its faces, cleavage-planes, optic axes or axes of elasticity, etc.—defined with reference to certain assumed directions, especially those of the crystallographic axes.

2. The process of determining the points of the compass, or the east point, in taking bearings. Hence—3. The act of taking one's mental bearings; ascertainment of one's true position, as in a novel situation, or with reference to new ideas, new studies, etc., as if by determining the points of the compass.

But let a man venture into an unfamiliar field, or where his results are not continually checked by experience, and all history shows that the most masculine intellect will oftentimes lose his orientation and waste his efforts in directions which bring him no nearer to his goal, or even carry him entirely astray. *C. S. Peirce, in Pop. Sci. Mo., XII. 4.*

4. The process of determining direction or relative position in general.

Tympanic sensibility plays no role in auditive orientation. *Amer. Jour. Psychol., 1. 610.*

5. In *crystal*, the process of placing a crystal in proper position so as to show the relation of its planes to the assumed axes.—6. In *zoöl.*, the faculty or instinct by which birds and other animals find their way home after being carried to a distance. It is well illustrated by homing pigeons. (See *homing*.) A striking instance of orientation is also afforded by swallows. Thus, a swallow nesting in New England, for example, and wintering in Panama, can return to the rafters in the barn where its nest was the previous year. All the regular and periodical migrations of birds imply the faculty of orientation.

And yet the spacious breadth of this division

Admits no orifice for a point as subtle

As Ariachne's broken wool to enter.

Shak., T. and C., v. 2. 151.

orifice (or'i-fis), *n.* [Formerly also *orifis*; < *F. orifice* = *Sp. Pg. orificio* = *It. orificio, orificio*, < *LL. orificium*, an opening, lit. the making of a mouth, < *L. os (or-), mouth, + facere, make*.] An opening; a mouth or aperture, as of a tube, pipe, or other similar object; a perforation; a vent.

Fast to the orifice.

The banner of St. Denis, supposed to have been a plain red gonfalon—that is, a bannulet of two or three points attached to a lance. It was preserved in the abbey of St. Denis near Paris, and in war was carried before the king of France as a consecrated flag (compare *church banner*, under *church*) and as the special royal ensign.

Sir Reynoide Camyan baneret that daye bare the *oriflamme*, a special relique that the Frenshe Kynges vse to bere before them in alle battayles.

And be your *oriflamme* to-day the helmet of Navarre.

Macaulay, Battle of Ivry.

They are shrubby or herbaceous perennials, with small undivided leaves, and globose or cylindrical heads of flowers with their bracts often enlarged and colored. *O. vulgare*, the wild marjoram, is gently tonic, diaphoretic, and emmenagogue, but at present little used. See *marjoram*, also *ditanny*, 3, and *hop-marjoram*.—**Oil of origanum**, marjoram-oil.

Origenism (or'i-jen-izim), *n.* [*< Origen* (see *def.*) + *-ism*.] The opinions held by or attributed to the Greek father Origen of Alexandria (born about A. D. 185, died about 253). The main characteristics of Origen's teaching were its union of philosophical speculation with Christian doctrine and its mystical and allegorizing interpretation of Scripture.

He insisted especially on the unity of all creation; he regarded Scripture as having generally a threefold sense, literal, moral, and mystical; he held the essential divinity and eternity of each person of the Trinity, but maintained that the Son is inferior to the Father and the Holy Ghost to the Son; he was the first to formulate the orthodox doctrine of eternal generation; he rejected prayer to Christ, though he defended prayer in the name of Christ; he regarded all sin as proceeding from a voluntary and moral self-determination to evil; he held that the human soul of Christ preexisted with other human souls; that the soul came into the body as a penalty for sin in a preexistent state; and he believed in a further moral progress and development after the present life, and defended prayer to Christ, though he defended prayer in the name of Christ; he regarded all sin as proceeding from a voluntary and moral self-determination to evil; he held that the human soul of Christ preexisted with other human souls; that the soul came into the body as a penalty for sin in a preexistent state; The original inhabitants of a country are those who were there first, whether native or not. See *primary*.—**3.** Inventive, creative.
